From this it is concluded that the constraints (3) on the coefficients a_{ij} are affected by the "prices" z just like the "resources" b in the usual economic interpretation. That is to say that, apart from possible discontinuities, the z_k measure $\partial FE / \partial \beta_k$. Or, to put it still in another way, the z measure the "scarcity" of the β . In addition, it can be shown that $\sum_k z_k a_{ki} = y_i x_i \geq 0$. Variations in the "resources"

b instead of in the elements of A lead to a similar problem: $\max FE = \sum c_i x_i$ subject to $Ax \leq b$, $x \geq 0$, and the linear constraint

$$(4) \quad \sum c_k b_i \leq \gamma_k \quad (k = 1, 2, \dots, r).$$

If t_k are the Lagrange multipliers associated with the constraints (4), the analogous result is that at the maximum value of FE one has the "trality":

$$\sum_j c_j x_j = \sum_i b_i y_i = \sum_k \gamma_k t_k,$$

as well as the equality

$$\sum_k t_k a_{ki} = y_i \quad (i = 1, 2, \dots, m).$$

Similarly, if the "costs" c are permitted to vary subject to the conditions:

$$(5) \quad \sum_j a_{kj} c_j \leq \gamma'_k$$

and the t'_k are the Lagrange multipliers associated with the constraints (5), the result is that at the maximum value of FE the "trality" holds: $\sum_j c_j x_j = \sum_i b_i y_i = \sum_k \gamma'_k t'_k$, as well as the equality $\sum_k t'_k a_{kj} = x_j$ ($j = 1, 2, \dots, n$). Finally, if the elements a_{ij} , the resources b_i , and the costs c_j are allowed to vary simultaneously and independently of each other, the result is that the following five equalities hold:

$$FE = \sum_j c_j x_j = \sum_i b_i y_i = \sum_k \gamma_k \beta_k = \sum_k t_k \gamma'_k = \sum_k t'_k \gamma_k.$$

The existence of a solution to a many-index problem in linear programming. (Russian)

Dokl. Akad. Nauk SSSR 158 (1964), 763-766.

Solvability conditions are established for the following "many-index" linear program: Minimize

$$L = \sum_{k \in M} p_{i_k} x_{i_k},$$

the variables being subject to the restrictions

$$\sum_{k \in M_j} a_{ij}^{(j)} x_{i_k} \leq b_{M_j, i_j}, \\ = b_{M_j, i_j},$$

$x_{i_1}, \dots, x_{i_n} \geq 0$; $j = 1, \dots, l$; $i_k = 1, \dots, n_k$; $k = 1, \dots, s$. Here $a_{ij}^{(j)}$, p_{i_k} are given real numbers, the b_{M_j, i_j} are given non-negative numbers.

6935

A dynamic programming algorithm for embedded Markov chains when the planning horizon is at infinity.

Management Sci. 10 (1963/64), 716-723.

R. A. Howard's policy-space approximation technique of dynamic programming over a Markov chain [*Dynamic programming and Markov processes*, Technology Press of M.I.T., Cambridge, Mass., 1960; MR 22 #9387] is extended to Markov renewal processes with a finite number of states (in addition to the Markovian transitions, the times between successive transitions from state i to state j are non-negative, independent and identically distributed random variables whose distribution depends upon i and j). A return function linear in time, with a fixed return at the end of the transition interval, is assumed. For each state i a choice of a policy from among k_i possible policies determines the return functions, the transition probabilities, and the expected intertransitions times corresponding to that particular state only.

Two models with infinite planning horizon are studied and algorithms for determining the optimal policies, which reduce to Howard's for common cases, are given and their convergence to optimal policies is proved. In the first model the time rate of return is taken as objective function and both ergodic and non-ergodic chains are dealt with. Two numerical examples illustrate the algorithm. In the second model with continuous discounting, the present value of the expected return from the process is maximized. The illustrative numerical example is as elaborate and suggestive as the other two.

The author points out that W. S. Jewell [*Operations Res.* 11 (1963), 938-948; MR 29 #677; *ibid.* 11 (1963), 949-971; MR 29 #678] has independently developed dynamic programming algorithms similar to those contained in the reviewed paper. B. Berescu (Bucharest)

On the transportation problem. II.

Cahiers Centre Études Recherche Opér. 4 (1962), 131-160.

The first four chapters were reviewed earlier [E. Balaş and P. Ivănescu, same *Cahiers* 4 (1962), 98-116; MR 26 #7447; E. Balaş and L. P. Hammer, *Acad. R. P. Romine Stud. Cerc. Mat.* 11 (1960), 439-450; MR 27 #1305; E. Balaş and P. Ivănescu, *ibid.* 12 (1961), 413-427; MR 27 #1306; *ibid.* 12 (1961), 429-435; MR 27 #1307; E. Balaş and L. P. Hammer, *Com. Acad. R. P. Romine* 11 (1961), 1047-1049; MR 27 #1308]. The authors show that solving the problem of minimizing $\sum_{i=1}^n \sum_{j=1}^m c_{ij} x_{ij}$ subject to $\sum_{j=1}^m x_{ij} = a_i$ ($i=1, \dots, m$), $\sum_{i=1}^n x_{ij} = b_j$ ($j=1, \dots, n$), $\sum_{i=1}^n x_{ij} \leq c_i$ ($i=1, \dots, m$; $0 < r < n$), $x_{ij} \geq 0$, is equivalent to solving the following ordinary transportation problem. Minimize $\sum_{i=1}^n \sum_{j=1}^m c_{ij} x_{ij}$ subject to $\sum_{j=1}^m x_{ij} = a_i$ ($i=1, \dots, m$), $\sum_{i=1}^n x_{ij} = b_j$ ($j=1, \dots, n$), $x_{ij} \geq 0$, where

$$\begin{aligned} a'_k &= a_k & (k=1, \dots, m), \\ &= a_{k-m} - c_{k-m} & (k=m+1, \dots, 2m), \\ b'_j &= b_j & (j=1, \dots, n), \\ c'_{kj} &= c_{kj} & (k=1, \dots, m; j=1, \dots, n), \\ &= c_{k-m, j} & (k=m+1, \dots, 2m; j=r+1, \dots, n), \\ &= C & (k=m+1, \dots, 2m; j=1, \dots, r). \end{aligned}$$

and C is sufficiently large.

The generalization to the case where one has the additional restriction $\sum_{i=1}^n x_{ij} \leq f_j$ ($j=1, \dots, n$; $0 < r < n$) is stated, and examples are provided.

6937

Application of pseudo-Boolean programming to the theory of graphs.

Z. Wahrscheinlichkeitstheorie und Verw. Gebiete 3, 163-176 (1964).

A pseudo-Boolean function is a function F with domain the n -tuples (x_1, \dots, x_n) , each $x_i = 0$ or 1 , the x_i obeying the rules of operation of a Boolean algebra, and with range the real numbers. "Pseudo-Boolean Programming" is a term coined by the authors for a recursive scheme for minimizing such functions. In short the scheme is this. Given $F(x_1, \dots, x_n)$, write it as $F = F_1(x_1, \dots, x_n) = x_1(F_1(1, x_2, \dots, x_n) - F_1(0, x_2, \dots, x_n)) + F_1(0, x_2, \dots, x_n) = x_1 g_1(x_2, \dots, x_n) + h_1(x_2, \dots, x_n)$. Clearly, if F_1 is to be minimized, then $g_1 > 0$ implies $x_1 = 0$; or, letting $S_1 = \{(x_2^*, \dots, x_n^*) | g_1(x_2^*, \dots, x_n^*) \leq 0\}$, $x_1 = 1$ only if $x_1^* = \sum_{S_1} \bar{x}_2 \dots \bar{x}_n = 1$, where $\bar{x}_i = x_i$ if $x_i^* = 1$ and $\bar{x}_i = 1 - x_i$ if $x_i^* = 0$. Then, substitute $x_1 = x_1^*$ into F_1 to obtain $F_2(x_2, \dots, x_n)$, a function in one fewer variables. Repeat to obtain finally $F_n(x_n) = x_n g_n + h_n$, g_n and h_n constants. If $g_n > 0$, let $x_n = 0$; if $g_n < 0$, let $x_n = 1$; if $g_n = 0$, take $x_n = 0$ or 1 ; then, iteratively, find x_{n-1}, \dots, x_1 (there may be many solutions).

In this paper the authors apply this scheme to compute the chromatic number, the number of internal stability, the number of external stability and the kernels of a finite graph (for definitions of these, see Berge [Théorie des graphes et ses applications, Dunod, Paris, 1958; MR 21 #1608; English transl., Methuen, London, 1962; MR 24 #A2381]) by formulating appropriate pseudo-Boolean functions whose minima yield the required answers.

6938

A linear search problem.

SIAM Rev. 6 (1964), 168-174.

A one-dimensional search problem is considered. A list $\{x_i, f(x_i)\}$, $i = 1, \dots, n$, is stored, the $\{x_i\}$ forming an ordered set with $x_i > x_j$ if $j > i$. It is desired to find $f(x)$ for some x in the list, given that the search proceeds by comparing x with some sequence of chosen arguments $\{x_k\}$. The problem is to choose the sequence in order to minimize the number of comparisons needed to find x . The author solves the problem through the recursive, functional equation approach of dynamic programming.

6940

Régions de décision et répartition de l'optimum dans la programmation linéaire.

C. R. Acad. Sci. Paris 280 (1964), 1333-1336.

Let $t = (t_1, \dots, t_r) \in T = \{t | 0 \leq t_i \leq \delta_i, 1 \leq i \leq r\}$ be a stochastic r -vector and c_0, c_1, \dots, c_r constant n -vectors. Define $c = c_0 + \sum_{i=1}^r c_i t_i$, and consider the linear program (I): Find $\gamma(t) = \min_{x \in X} c(t)x$; $X = \{x | Ax = b, x \geq 0\} \neq \emptyset$, with the usual meaning for A, b , and x . Then, if X is bounded and all bases are non-degenerate, there exists a set of convex polyhedral sets $S_i \subset T$ ($1 \leq i \leq q$), called "regions of decision" of (I), associated with a set of basic solutions \bar{x}_i corresponding to basis B_i and a set of $(r+1)$ -vectors $\alpha_i = (\alpha_{i0}, \alpha_{i1}, \dots, \alpha_{ir})$ ($i = 1, 2, \dots, q$), such that (i) $\bigcup_i S_i = T$, (ii) $t \in S_i$ implies $\gamma(t) = c(t)\bar{x}_i = \alpha_{i0} + \alpha_{i1}t_1 + \alpha_{i2}t_2 + \dots + \alpha_{ir}t_r$, (iii) $i \neq j$ implies $P\{t \in S_i \cap S_j\} = 0$. The regions S_i are described by systems of linear inequalities and the distribution function, the mean of $\gamma(t)$ and the probability that a given basis be optimal are obtained in terms of the probability distribution of t , the vectors α_i and the regions S_i . Finally, similar developments are obtained via duality, i.e., the vector b is assumed to be a stochastic variable given in the form $b = b_0 + \sum_{i=1}^r b_i t_i$ and the rest of the program coefficients to be constant. The proofs of all these results are to be published in a forthcoming paper.

Descloux, Jean

6941

Note on convex programming.

J. Soc. Indust. Appl. Math. 11 (1963), 737-747.

The author considers the problem of finding a point $\bar{x} \in E_n$ which minimizes the convex function $F(x) = \max_{A \in \Omega} \{[A, x] - b(A)\}$ subject to $G(x) = \max_{A \in \Lambda} \{[A, x] - c(A)\} \leq 0$. Here b and c are continuous real-valued functions on E_n , $[A, x]$ denotes the scalar product and the sets Ω and Λ of E_n are supposed to satisfy the Haar condition: each set of n vectors of $\Omega \cup \Lambda$ are linearly independent. The author describes an iterative method which yields a converging sequence x_k with $\lim x_k = \bar{x}$, if Ω and Λ are (possibly infinite) compact sets. His algorithm is a generalization of a method proposed by Cheney and Goldstein [Numer. Math. 1 (1959), 253-268; MR 22 #316] in the case of finite sets Ω and Λ . It consists in choosing a sequence of "bases" $I_k = \{A_1^k, \dots, A_n^{k+1}\} \subseteq \Omega \cup \Lambda$, $I_k \cap I_{k+1} \neq \emptyset$ so that (1) $I_k \cap I_{k+1}$ contains n elements, (2) 0 lies in the convex hull of I_k , and (3) the values $\mu_k = F_{I_k}(x_k)$ at the optimal points x_k of the restricted problem of minimizing $F_{I_k}(x) = \max_{A \in I_k, A \in \Omega} \{[A, x] - b(A)\}$, subject to $G_{I_k}(x) = \max_{A \in I_k, A \in \Lambda} \{[A, x] - c(A)\} \leq 0$, increase strictly if $x_k \neq \bar{x}$.

J. Stoer (Munich)

Hanson, M. A.

6942

Stochastic non-linear programming.

J. Austral. Math. Soc. 4 (1964), 347-353.

Let Y be a subset of E_n and let $y \in Y$ have the scalar distribution $\phi(y)$, where ϕ is C^∞ on Y . Let X be a subset of E_n and let $S = X \times Y$. Let $\phi(x, y)$ be a scalar-valued function on S with range in E , and let $h(x, y)$ be a vector-valued function on S with range in E_r . The problem considered is the following one. Determine an x_0 in X that minimizes $\mathcal{E}\phi(x, y)$ subject to the constraints $\mathcal{E}g(x, y) \geq 0$ and $h(x, y) \geq 0$ for all y in Y , where

$$\mathcal{E}f(x, y) = \int_Y f(x, y)\phi(y) dy.$$

The analysis of the problem is carried out under certain assumptions on the constraints g and h .

The first theorem of the paper gives necessary conditions for a minimizing x_0 , analogous to the multiplier rule and the Kuhn-Tucker conditions. The second theorem asserts that under appropriate concavity and convexity hypotheses on ϕ , g , and h , the necessary conditions are also sufficient. The third theorem is a duality theorem that asserts that under the convexity and concavity hypotheses of Theorem 2, the minimizing x_0 is also the maximizing x_0 for an appropriately defined maximizing problem.

(Reviewer's note: The statements of the three theorems are incorrect. Statement (4) of Theorem 1 should read $\delta(\phi + \lambda g_2) + \mu(g)h_2(x, y) = 0$, and appropriate changes should be made in the corresponding statements of Theorems 2 and 3. The various proofs can be readily modified to accommodate the correct statements. The reviewer finds the proof that $\lambda \leq 0$ and $\mu \leq 0$ somewhat obscure. In particular, the ability to choose x^* as described on page 350 is not clear, since the condition $\|x - x^*\|^2 = o(\|g'(x, y) - g'(x^*, y)\|)$ implies that if $x \neq x^*$, then $g'(x, y) \neq g'(x^*, y)$ for all components g' of g such that $g'(x, y) = 0$. Finally, there seems to be some confusion between $\delta g'(x, y)$ and $g'(x, y)$ throughout the proof of Theorem 1 on page 350.)

6943

Die Optimierung eines halbkontinuierlichen chemischen Reaktors mittels dynamischer Programmierung.

Analogue Computation Applied to the Study of Chemical Processes (Proc. Internat. Seminar, Brussels, 1960), pp. 16-21. Presses Acad. Européennes, Brussels, 1961; Gordon and Breach, New York, 1962.

In chemical engineering it frequently happens that the output of one stage of processing is used as the input to the next. This suggests that it may be fruitful to view them as dynamic programming processes for the purpose of optimization. Beginnings have been made in recent books [cf., e.g., R. Aris, *The optimal design of chemical reactors*, Academic Press, New York, 1961; MR 23 #B473]. This interesting and well-written paper shows how to formulate the reaction rate and mass balance equations, apply Bellman's principle of optimality, and employ a Lagrange multiplier to simplify the calculations. It is suggested that an analogue computer (with some auxiliary logical circuitry) be used, and some numerical results are quoted. The paper is accessible to both mathematicians and chemical engineers.

6944

Two-person nonzero-sum games and quadratic programming.

J. Math. Anal. Appl. 9 (1964), 348-355.

Authors' summary: "It is shown that a necessary and sufficient condition that a point be a Nash equilibrium point of a two-person nonzero-sum game with a finite number of pure strategies is that the point be a solution of a single programming problem with linear constraints and a quadratic objective function that has a global maximum of zero. Every equilibrium point is a solution of this programming problem. For the case of a zero-sum game, the quadratic programming problem degenerates

to the well-known dual linear program associated with the game."

The quadratic objective function is not necessarily concave, but the authors suggest that, on the basis of computational experience, the gradient projection method works satisfactorily nevertheless; since the value of the global maximum is known, local maxima may easily be rejected.

Krylov, V. Yu. [Krylov, V. Ju.]

Examples of games with automata.

Dokl. Akad. Nauk SSSR 149 (1963), 284-287 (Russian); translated as Soviet Physics Dokl. 8 (1963), 232-234.

This short paper gives a general definition and two examples of games in which the players are finite automata playing a game repeatedly. For each play of the game a strategy is chosen which determines the probability of a win or loss of one unit for each player; information on the wins or losses in any one play is used to determine the strategy for the following play.

In one of the examples, a game is defined between two automata in which one of the players wins and the other loses in every play. The players are assumed to be employing a type of strategy called a "linear tactic", which was defined in a previous paper [Cetlin, same Dokl. 149 (1963), 52-53; MR 26 #3531]. For such a game a limiting expectation W is shown to exist and to satisfy certain properties depending on the payoff matrix. If the payoff matrix has a row (or column) with all entries non-negative, then W is said to be equal to the harmonic mean of the elements of this row (or column), otherwise $W = 0$.

Fleming, Wendell H.

6947

The convergence problem for differential games. II.

Advances in game theory, pp. 195-210. Princeton Univ. Press, Princeton, N.J., 1964.

In a differential game, the motion of a point ξ in euclidean space E^n during a time interval T is influenced by strategic choices made by two players at each instant of T . The payoff is $U[\xi(T)] + \int_0^T f(\xi(t), y(t), z(t)) dt$, where y and z are the strategic variables under the control of the two players; the way in which y and z affect the motion of ξ may be described by a differential equation $\dot{\xi} = g(\xi, y, z)$. Rigorizing the above description is a non-trivial task. The approach used by the author is to divide T into n equal time units and to allow the players to make their choices at the beginning of each unit only; denote the value of such a "discretized" game by V_n . In a previous

paper [J. Math. Anal. Appl. 3 (1961), 102-116; MR 25 #5806] the author showed that V_n converges as $n \rightarrow \infty$, if certain rather restrictive assumptions are made about f and g . In this paper convergence is proved without any of those restrictive assumptions. The proof makes use of a number of recent results on non-linear parabolic differential equations.

6948

n-person games in partition function form.

Naval Res. Logist. Quart. 10 (1963), 281-298.

Let N be a set with n members, called players. A partition of N is a family of disjoint subsets of N whose union is N . A partition function F assigns to each partition P and each member P_i of P a real number $F_P(P_i)$; a pair (N, F) is called a game in partition function form. The partition function generalizes the von Neumann-Morgenstern (N-M) characteristic function [von Neumann and Morgenstern, *Theory of games and economic behavior*, Princeton Univ. Press, Princeton, N.J., 1944; MR 6, 235]; unlike the characteristic function, the partition function allows the payoff to a coalition M to depend on how the players outside M have combined into coalitions.

The notions of imputation, domination, effectiveness, core and solution are defined in a manner analogous to the N-M definitions. The results, however, are quite different. For example, the standard simplex of imputations in the N-M theory is replaced by a finite number of parallel simplexes, and a single solution may have pieces in several of these simplexes.

All solutions are found for all 2- and 3-person games, and for games in which $F_{(N)}(N)$ is sufficiently large compared to the other values of F (in which case the other values do not matter). The most interesting games discussed are the general 3-person games; it turns out that in comparison with the N-M 3-person results, the individual solutions are often larger, but there are usually fewer solutions and often the solution is unique.

Burger, E.

6950

Bemerkungen zum Aumannschen Core-Theorem.

Z. Wahrscheinlichkeitstheorie und Verw. Gebiete 2, 148-153 (1964).

A simplification of the theory of cooperative games without side payments due to Peleg and the reviewer [Bull. Amer. Math. Soc. 66 (1960), 173-179; MR 23 #10802] (the AP theory) is presented. In the author's

approach, a game is characterized entirely by its characteristic function, and the compact polyhedron H of "actually feasible" payoff vectors in the AP theory is replaced by $v(N)$, where N is the set of all players. The author shows that many of the theorems of AP theory carry over to his version. In particular, in a given game let E be the set of feasible payoff vectors (H in the AP theory, $v(N)$ in the author's); E and A the sets of group rational and individually rational members of E , respectively; and $A = E \cap A$. The reviewer has shown [Trans. Amer. Math. Soc. 98 (1961), 539-552; MR 23 #B483] that the cores associated with all four of these sets coincide in the AP theory. The author shows that a much simpler proof of this theorem can be given in his theory.

Radström, Hans

6951

A property of stability possessed by certain imputations.

Advances in game theory, pp. 513-529. Princeton Univ. Press, Princeton, N.J., 1964.

Let v be a constant-sum superadditive characteristic function on a player set I . A coalition structure (c.s.) is a family F of subsets of I with the properties: $I \in F$, $\emptyset \notin F$; every S in F with more than one player splits uniquely into a pair of elements of F (called the parties of S , and co-parties of each other); every S in F other than I is a party of precisely one member of F . Intuitively, the members of F are bargaining units; once it is determined that an S in F receives the total payoff $w(S)$, the parties of S bargain for their share of $w(S)$, and this process continues until the payoff of each player is determined. The author proves that with each c.s. F it is possible to associate an imputation w so that: (1) If I_1 and I_2 are the parties of I , then $w(I_1) = v(I_1)$ and $w(I_2) = v(I_2)$, where $w(S) = \sum_{i \in S} w_i$; (2) Let S_1 and S_2 be parties of an S in F , S_3 the co-party of S , F_1 [F_2] the c.s. obtained from F by deleting S and adding $S_1 \cup S_3$ [$S_2 \cup S_3$], and w_1 [w_2] the imputation associated with F_1 [F_2]; then $w(S_1) = \frac{1}{2}\{w(S) + w_1(S_1 \cup S_3) - w_2(S_2 \cup S_3)\}$, and similarly for S_2 . Intuitively, (2) says that S_1 and S_2 share $w(S)$ in such a way that any threat by S_1 [S_2] to get a larger payoff by teaming up with S_3 can be matched with similar arguments by S_2 [S_1]. The w satisfying (1) and (2) is unique, and the author derives a formula for it in terms of v .

6952

On topological games.

Proc. Cambridge Philos. Soc. 61 (1965), 165-171.

The games considered are those introduced by Berge [Contributions to the theory of games, Vol. 3, pp. 165-178, Princeton Univ. Press, Princeton, N.J., 1957; MR 19, 1147], converted into two-person constant-sum games by confining the investigation to maximin questions. The author finds two systems of sufficient conditions for the existence of maximin strategies.

6953

Optimal distribution of bounded means for convex-concave payoff functions. (Russian)

Izv. Akad. Nauk SSSR Tekhn. Kibernet. 1964, no. 5, 100-106.

Author's summary: "Conditions are found, the fulfillment of which guarantees an optimal distribution $\phi(x)$ of bounded mean Φ over the space X . The distribution is called optimal if it gives the largest value to the mean payoff. The investigation is carried out for a known a priori probability $p(x)dx$ obtained from the payoff $P(\phi, x)dx$, where the payoff function $P(\phi, x)$ has an interval $(0, \phi_1)$ of convexity downward and the interval (ϕ_1, ∞) of convexity upward."

6954

A computational note on von Neumann's algorithm for determining optimal strategy.

Naval Res. Logist. Quart. 11 (1964), 75-78.

The author compares the speeds of convergence of the following forms of iterative methods for solving matrix games by applying them to some numerical examples: (1) von Neumann's Predictor-Corrector Algorithm, (2) The Simplex Method, (3) Brown's Fictitious Play, and (4) A Relaxation Method. He draws the conclusion that the von Neumann algorithm is inferior to the others.

BIOLOGY AND BEHAVIORAL SCIENCES

Ewens, W. J.

6955

The diffusion equation and a pseudo-distribution in genetics.

J. Roy. Statist. Soc. Ser. B 25 (1963), 405-412.

Consider the distribution function $F(x, t)$ ($0 \leq x \leq 1$) of a variate x at time t whose density function $f(x, t)$ satisfies the forward Kolmogorov equation

$$\frac{\partial f(x, t)}{\partial t} = \frac{1}{2} \frac{\partial^2}{\partial x^2} \{v(x)f(x, t)\} - \frac{\partial}{\partial x} \{m(x)f(x, t)\}.$$

Here $m(x)$ and $v(x)$ are the instantaneous drift and diffusion coefficients, respectively. The particular case $m(x) = x(1-x)\phi(x)$, $v(x) = ax(1-x)$, where $\phi(x)$ is an arbitrary polynomial (possibly constant or zero) and a is a constant, is found in genetical applications. This implies that $x=0$, $x=1$ are "exit" boundaries. This corresponds in genetics to the fixation of a certain gene in a population.

If we solve the "stationary" equation

$$\frac{1}{2} \frac{d^2}{dx^2} \{v(x)f(x)\} - \frac{d}{dx} \{m(x)f(x)\} = 0,$$

we obtain successively

$$\frac{1}{2} \frac{d}{dx} \{v(x)f(x)\} - m(x)f(x) = c_1,$$

and

$$f(x) = \frac{c_2 \phi(x)}{v(x)} + \frac{2c_1}{v(x)} \int_0^x \{\phi(y)\}^{-1} dy,$$

which we may alternatively write (if $c_1 \neq 0$)

$$f(x) = \frac{2c_1}{v(x)} \phi(x) \int_0^x \{\phi(y)\}^{-1} dy,$$

where the constant c is related to c_2 .

An interpretation of $f(x)$ as a description, in a certain sense, of the transient behaviour of the diffusion process

is given. Interpretations of other solutions, obtained by a different allocation of constants, are given. An analogous function for a certain discrete process is exhibited.

6957

Multidimensional scaling by optimizing goodness of fit to a nonmetric hypothesis.

Psychometrika 29 (1964), 1-27.

Let E be a metric space with metric d . Let there be given, a rank order $>$ on the $\frac{1}{2}n(n-1)$ pairs (i, j) of integers from 1 to n with $i < j$. A configuration is an n -tuple $X = (x_1, \dots, x_n)$ of points in E , not all equal; it is a perfect scale for the given order if $(i, j) > (k, m)$ is equivalent to $d(x_i, x_j) > d(x_k, x_m)$. There may not be a perfect scale. For each X , the author defines the stress $S(X)$ as the infimum of $\sum_{(i,j) \in E} (d(x_i, x_j) - d_{ij})^2 / \sum_{(i,j) \in E} d^2(x_i, x_j)$, taken over all choices of $\frac{1}{2}n(n-1)$ numbers d_{ij} such that $d_{ij} > d_{km}$ is equivalent to $(i, j) > (k, m)$; $S(X)$ measures the failure of X to be a perfect scale. The stress of the order is defined as the minimum of $S(X)$ over all X ; it measures the failure of the order to have a perfect scale in E . E is usually taken to be a euclidean space of fixed dimension with one of the p metrics, $1 \leq p \leq \infty$. This definition provides a basis for techniques in psychology where dissimilarities between n objects are matched by distances between n points. A novelty of the author's approach is that only the rank order of the dissimilarities is used, not any cardinal measure of their size. Examples are given.

★Language and information. Selected essays on their theory and application.

Addison-Wesley Series in Logic.

Addison-Wesley Publishing Co., Inc., Reading, Mass.; London; The Jerusalem Academic Press, Ltd., Jerusalem, 1964. x + 288 pp. \$12.50.

This volume contains a reprinting of twenty of the author's papers, and is arranged as follows. Part I: four papers on the theoretical aspects of language; Part II: five papers on algebraic linguistics; Part III: five papers on machine translation; Part IV: three papers on semantic information; Part V: three papers on the mechanization of information retrieval.

In a 16-page introduction the author reminisces a bit about the writing of various of the papers. More important, the author recounts his experiences with machine translation and the widely discussed problem of information retrieval (which has become stigmatized by the clichés "publication explosion" and "information and documentation explosion"), and the last paper in Part V (entitled "Is Information Retrieval Approaching a Crisis?" and reprinted from *American Documentation* 14 (1963), 95-98) provides a sensible contrast to many of the amateur coups d'œil (e.g., Derek J. de Solla Price, *Little science, big science* (Columbia Univ. Press, New York, 1963)), which now seem to constitute a second-level publication explosion.

A. J. Lohwater (Providence, R.I.)

Oettinger, A. G.

6960

An essay in information retrieval or the birth of a myth. *Information and Control* 8 (1965), 64-79.

Author's summary: "A frequently quoted and still current myth on the ill effects of the so-called information explosion is analyzed. Five years and 250,000 dollars were allegedly spent in the United States to duplicate the result published in the Soviet Union in 1950. Not only does this myth rest on a comedy of errors, but the trivial results in question were surprisingly well known to all specialists most concerned, in at least one instance as early as 1937."

The comedy of errors refers to the use made of a paper of A. G. Lune [Dokl. Akad. Nauk SSSR 70 (1950), 421-423; MR 11, 874] by over-zealous proponents in the area of information retrieval [for some interesting comments on such zealotry see some of the reminiscences in #6959 reviewed above]. As Oettinger points out, the myth was even carried to the floor of the U.S. Congress by the Hon. Roman C. Pucinski, who asserted that a "team of top-notch mathematicians" worked for five years to obtain an independent solution of a relatively trivial and unimportant result. The paper continues with a selection from the luxuriant growth of the second-level publication concerning scientific publication, so thickly has this rain-forest proliferated that highly relevant references have been overlooked (e.g., R. P. Boas, Jr., *Science* 125 (1957), 1260), fortunately, however, without the loss of enough money to cause comment on the floor of the U.S. Congress. The question may be asked: Would it have been cheaper to train this "team of top-notch mathematicians" in the simplest research techniques, the use of journals and reference tools, etc., than to deluge them with a third-level publication of print-out matter containing (hopefully) all possible applications and corollaries of a given result. Boas's earlier strictures [loc. cit.] still indicate that no easy substitute for competent scholarship is yet in sight.

The second part of the paper contains an illustration of how the Lune paper in question might be translated.

6961

Über verallgemeinerte quasilineare Mittelwerte, die mit Gewichtsfunktionen gebildet sind.

Publ. Math. Debrecen 10 (1963), 171-190.

Let I be an interval on the real line, let φ be a strictly monotone continuous function on I and let f be a non-negative continuous function on I not vanishing on any subinterval of positive length. The generalized quasi-linear mean value of points $x_1, x_2, \dots, x_n \in I$ is defined by the formula

$$M_\varphi(x_i, f) = \varphi^{-1} \left[\frac{\sum_{i=1}^n f(x_i) \varphi(x_i)}{\sum_{i=1}^n f(x_i)} \right].$$

In the first portion of this paper the authors obtain a necessary and sufficient condition that the equality of mean values $M_\varphi(x_i, f) = M_\varphi(x_i, g)$ holds. Next they investigate the equation of homogeneity $M_\varphi(x_i, f) = t M_\varphi(x_i, f)$. They prove that the problem of determining all homogeneous generalized quasi-linear mean values is equivalent to the problem of determining all solutions of a vector-matrix functional equation. After solving this functional equation they are able to give explicit expressions for all those generalized quasi-linear mean values which satisfy the homogeneity equation. In the last paragraph of the paper the authors remark that since, in some cases, $M_\varphi(x, y, f) = M_\varphi(x, f) M_\varphi(y, f)$, there would appear to be some applications of their mean value theory to the entropy concept of information theory. They show that the two (classical) definitions of entropy

$$I_\alpha(x_i) = \frac{1}{1-\alpha} \log \left(\frac{\sum_{i=1}^n x_i^\alpha}{\sum_{i=1}^n x_i} \right) \quad (\alpha \neq 1),$$

$$I_1(x_i) = - \sum_{i=1}^n x_i \log x_i / \sum_{i=1}^n x_i$$

[A. Rényi, *Wahrscheinlichkeitsrechnung. Mit einem Anhang über Informationstheorie*, VEB Deutscher Verlag, Berlin, 1962; MR 26 #5597] are special cases of their results. Finally some open problems are discussed.

G. Mallese (College Park, Md.)

Umegaki, Hisaharu

6962

General treatment of alphabet-message space and integral representation of entropy.

Kôdai Math. Sem. Rep. 16 (1964), 18-26.

Instead of the "message space" A' consisting of all doubly infinite sequences $a = (\dots, a_{-1}, a_0, a_1, \dots)$ (where the a_i 's belong to some finite set A) the author considers more generally a totally disconnected compact Hausdorff space X with a fixed homeomorphism S onto itself, playing the role of the shift. Theorems on entropy (more exactly: entropy rate) of information sources are generalized for this abstract set-up, the proofs being similar to the original ones. In particular, for any "clopen" partition \mathcal{E} (i.e., partition consisting of closed-open sets) the existence of a universal bounded, non-negative, S -invariant Borel-measurable function $h(x) = h(x, \mathcal{E}, S)$ is proved such that for every S -invariant regular probability measure p on X , $H(p) = \int_X h(x) dp(x)$ and

$$h(x) = h_p(x) = - \sum_{\mathcal{E} \in \mathcal{E}} P_p(U|\mathcal{E}_\infty)(x) \log P_p(U|\mathcal{E}_\infty)(x)$$

for p -a.e. $x \in X$. Here the entropy $H(p) = H(p, \mathcal{E}, S)$ is defined—as usual in ergodic theory—as the limit $\lim_{n \rightarrow \infty} (1/n) H(\bigvee_{i=0}^{n-1} S^{-i} \mathcal{E})$, and $P_p(U|\mathcal{E}_\infty)(x)$ denotes the

conditional probability with respect to the σ -field generated by $\{S^{-k}2\}_{k=1}^{\infty}$, with underlying probability measure p . For the case $X=A'$ this theorem was proved by K. R. Parthasarathy [Illinois J. Math. 5 (1961), 299-305] and independently by K. Jacobs [Math. Z. 78 (1962) 33-43; MR 26 #286]. The functional $H(\xi) = \int_X h(x) d\xi(x)$ defined on the Banach space of all S -invariant bounded regular signed measures ξ on X coincides with the entropy functional introduced by the author [Kódai Math. Sem. Rep. 15 (1963), 162-175; MR 28 #2189].

Umegaki, Hisaharu

6963a

A functional method for stationary channels.
Kódai Math. Sem. Rep. 16 (1964), 27-39.

Umegaki, Hisaharu

6963b

Supplement and correction to the preceding paper "A functional method for stationary channels".
Kódai Math. Sem. Rep. 16 (1964), 189-190.

An abstract generalization of the concept of a stationary channel is given, by replacing the input and output message spaces A' and B' by arbitrary compact Hausdorff spaces X and Y with fixed homomorphisms S and T , respectively, playing the role of the shift. Assuming further that X and Y are totally disconnected spaces, the results of the author's paper above [#6962] can be applied, and theorems on the integral representation of the transmission functional are proved. Here the transmission functional $\mathfrak{R}(\xi; \mathfrak{L}, \mathfrak{G})$ corresponding to given "clopen" partitions \mathfrak{L} of X and \mathfrak{G} of Y is defined with the aid of the entropy functional [cf. #6962 above] analogously to the usual definition of transmission rate. The exact analogue of K. R. Parthasarathy's theorem [Illinois J. Math. 5 (1961), 299-305] is proved under an additional measurability hypothesis called (CT); hence, by introducing

$$C_s = \sup\{\mathfrak{R}(p; \mathfrak{L}, \mathfrak{G}), p \in \mathcal{P}(X, S)\},$$

the equality

$$C_s = \sup\{\mathfrak{R}(p; \mathfrak{L}, \mathfrak{G}), p \in \mathcal{P}_s(X)\}$$

follows, where $\mathcal{P}(X, S)$ and $\mathcal{P}_s(X)$ denote the set of all S -invariant probability measures and all ergodic probability measures on X , respectively. Also, the abstract version of R. L. Adler's theorem [Proc. Amer. Math. Soc. 12 (1961), 924-930; MR 24 #B2504] on equality of stationary (C_s) and ergodic (C_e) capacities is stated. In the original paper the capacity C_s is stated to be attained (for some $p \in \mathcal{P}_s(X)$) under a continuity hypothesis; in the supplement, however, the proof of this statement is pointed out to be incorrect. Further, in the supplement, the author points out that the integral representation theorem of Parthasarathy type and its consequence

$$C_s = \sup\{\mathfrak{R}(p; \mathfrak{L}, \mathfrak{G}), p \in \mathcal{P}_s(X)\}$$

are valid for arbitrary compact metric spaces X and Y and arbitrary finite measurable partitions \mathfrak{L} and \mathfrak{G} .

6964

Detection of randomly appearing targets in a multi-channel system. (Russian)
Tredy Mat. Inst. Steklov. 71 (1964), 113-117.

Results of the author [Teor. Veroyatnost. i Primenen. 8 (1963), 431-443; MR 28 #649] are extended to observation of the outputs, not of one, but of n independent channels with equal signal-to-noise ratios (SNR). A target is declared present in a given direction if the output of at least one channel exceeds a threshold after that direction is observed for a fixed time T_0 . The mean time $\tau(T, N, n)$ between appearance of a target and its detection is for $T \rightarrow \infty$ asymptotically $\tau(T, N, n) \sim \frac{1}{2}(N+2) \ln T$, where N is the number of directions observed and T is the mean time between false alarms, provided $\ln n = o(T_0)$. The unit of time is $\Delta/(\text{SNR})$, where Δ is the sampling interval.

6965

Nonsupervised adaptive signal detection and pattern recognition.

Information and Control 7 (1964), 416-444.

Authors' summary: "Adaptive signal detection and pattern recognition can be viewed as a problem in statistical classification wherein the partitioning of an n -dimensional sample space into category (signal) regions is determined through estimation from a set of samples from the categories. When the correct associations of the samples are known, the problem is the commonly treated supervised one. This paper, examining the nonsupervised case wherein the correct associations of the samples are unknown, demonstrates that it is possible under extremely general conditions to achieve effective adaptation without supervision. With particular emphasis on a two-category (binary detection) model, general conditions are described under which nonsupervised adaptation is possible, and specific simple yet rapidly convergent techniques are presented under varying degrees of prior knowledge of the statistical properties of the data.

"Most of the paper is concerned with a two-category case where the corresponding (equiprobable) distributions differ only in location. The paper proceeds by examining the over-all probability distribution comprised of the two-component category distributions, and the adaptation treated is directed toward determining the decision boundary, or the distribution parameters necessary for defining it. For univariate normal distributions, various estimators (and their convergence properties) of the over-all mean are examined. For multivariate monotone (including normal) distributions the over-all sample covariance matrix is used to obtain the component covariance matrices when these are general (including the colored noise case), or simply to obtain the principal eigenvector (of the overall matrix) when the component distributions are spherically symmetric (white noise). A hill-climbing algorithm is included. These results for the important model of binary signal detection in gaussian noise demonstrate that no prior knowledge of the signal or noise parameters is required for nonsupervised adaptation to the optimum detector. It is shown in one dimension that for equiprobable component distributions of almost any functional form and differing only by translation we can obtain category distribution estimators which converge uniformly over the real line with probability 1. Considered also are the cases of different a priori probabilities, the problem of tracking, and some aspects of the multiple-category problem."

**Linguistică matematică. Modele matematice în lingvistică* [Mathematical linguistics. Mathematical models in linguistics].

Editura Didactică și Pedagogică, Bucharest, 1963. 220 pp. Lei 9.40.

This book is based in part on a course in mathematical linguistics given by the author at the University of Bucharest in the years 1961 through 1963. The orientation of the book is based on the notion of opposition due to F. de Saussure, which led N. Trubetzkoy to construct a classification of different types of phonological opposition, and which was later improved by J. Cantineau. The further investigations of A. Martinet, L. Hjelmalev, Z. Harris, N. Chomsky, A. Reformatski, I. Revzin, R. Dobrukin, and S. Saumyan form the basis for the author's treatment.

The style is distinctly mathematical (i.e., definition, theorem, proof) and is sprinkled with appropriate introductions, observations, and examples (Roumanian and Russian). The only mathematical preparation needed is a knowledge of elementary set theory, relation theory, combinatorial algebra, logic, and mappings.

The scope of the book is indicated by the following chapter headings: Logical theory of linguistic opposition, The phoneme, morphemes and quasimorphemes, Functional methods in morphemic analysis, Grammatical categories, Models based on partitions and on the relation of government, and Mathematical modeling of the parts of speech. The bibliography contains an extensive list of 301 references covering the work of American and European linguists. Unfortunately, the book will have little influence on English-speaking linguists since it is in Roumanian.

6967

Grammars with linear memory. (Russian)

Algebra i Logika Sem. 2 (1963), no. 5, 43-55.

Let G denote a grammar, let $L(G)$ denote the language generated by G , and let $|W|$ denote the length of the word $W \in L(G)$. Call G a linear bounded grammar ("grammar with linear memory" in the author's terminology) if there exists a natural number k such that for any word $W \in L(G)$, obtained, say, by a derivation $S \Rightarrow W_0 \Rightarrow W_1 \Rightarrow \dots \Rightarrow W_n = W$, one has that $|W_i| \leq k|W|$, $i = 0, 1, \dots, n$. (Through a misprint, the " k " is omitted in the definition, but later usage in the paper suggests that this is what the author intended.) It is shown that the class of linear bounded languages coincides with the class of context-sensitive languages, that any language accepted by a bounded linear automaton ("any language recognizable by linear memory" in the author's terminology) is a bounded linear language, hence, context-sensitive, and, finally, that the intersection of any finite set of linear bounded languages is again a linear bounded language. (Thus the results overlap those of Landweber [Information and Control 6 (1963), 131-136; MR 29 #3201]; see also the following review [#6968].)

R. M. Baer (Berkeley, Calif.)

Kuroda, S.-Y.

6968

Classes of languages and linear-bounded automata.

Information and Control 7 (1964), 207-223.

Here a linear bounded grammar is defined as a context-

sensitive grammar which is of order 2, is length-preserving, and satisfies: $S \Rightarrow EF$ implies $E = S$, the initial symbol. (The order of a grammar is the maximum of the lengths of strings occurring in the rules.) For any context-sensitive grammar there is an equivalent linear bounded grammar. The converse of a result of Landweber [see #6967 above for reference], when shifted to the context of nondeterministic linear bounded automata, yields a characterization of the context-sensitive languages as those accepted by (non-deterministic) linear bounded automata. And, among other results, it is shown that the context-free languages are accepted by (deterministic) linear bounded automata.

At one point the author introduces a linear bounded automaton coupled to a certain type of counter (which presumably is just a second tape) and claims that the resulting device is again a linear bounded automaton. This point deserves a bit more discussion than is accorded it in the text.

R. M. Baer (Berkeley, Calif.)

Žiták, František

6969

Quelques remarques au sujet de l'entropie du tchèque.

Trans. Third Prague Conf. Information Theory, Statist. Decision Functions, Random Processes (Liblice, 1962), pp. 841-846. Publ. House Czech. Acad. Sci., Prague, 1964.

The author makes two remarks about certain information-theoretic properties of the Czech language. The first remark concerns the entropy of written Czech using a modification of the method used by M. H. Hanson on Swedish, in which native speakers guess a phrase letter-by-letter. As an estimate of the entropy, a sample mean of $H = 2.40$ is obtained. The second remark concerns the morphological homonymy present in Czech grammar in comparison with that of Latin, German (with the definite article), and German (without the definite article). The analysis uses simple concepts from the theory of partitions, and the entropies for nouns are summarized in a table.

6970

Theory of a linear system with stationary time lag and periodically varying parameter. (Russian. English summary)

Avtomat. i Telemekh. 25 (1964), 1067-1074.

Continuing his earlier work [Avtomat. i Telemekh. 21 (1960), 15-19; MR 22 #9385; ibid. 21 (1960), 1279-1292; MR 23 #9422; Prikl. Mat. Meh. 25 (1961), 284-293; MR 24 #A1474; *Analytic methods in the theory of non-linear vibrations*, Proc. Internat. Sympos. Non-linear Vibrations, Vol. I, 1961, pp. 417-424, Izdat. Akad. Nauk Ukrain. SSR, Kiev, 1963; MR 27 #5998], the author studies a linear system written in operational form as follows: (1) $y = W(p)x$, $x = \mu\varphi(t)y$, where (2) $W(p) = \exp(-pr) \cdot M(p)/D(p)$, where M and D are polynomials in p , μ is a scalar, and φ is continuous in t , of period T . (1) is derived apparently by Laplace transform techniques. By using results of the paper cited above, the author derives a characteristic equation, whose roots serve to determine the stability of (1). Then a Floquet representation of a certain solution of (1) is obtained, where the roots of the characteristic equation appear as characteristic exponents.

6971

A variational problem in the theory of equations of elliptic type. (Russian)

Sibirsk. Mat. Zh. 5 (1964), 500-508.

Let D be an open bounded subset of 3-dimensional space, with smooth boundary S , and let U be some bounded subset of r -dimensional space. The problem is to choose $u(x)$ with values in U to minimize

$$I = \iint_S \alpha(x) z(x) dS + \iiint_D \beta(x) z(x) dx,$$

where the function z is determined in D by the partial differential equation $\Delta z = F(x, z, u(x))$, where Δ is the Laplace operator, together with the data $dz/dn + \lambda z = f(x)$ on S , $\lambda > 0$. The function F is assumed to satisfy a Lipschitz condition in (z, u) . The main result is the maximum principle in the following form. Let $u(x)$ satisfy the linear partial differential equation

$$\Delta u = \frac{\partial F(x, z(x), u(x))}{\partial z} u - \beta(x)$$

with the data $du/dn + \lambda u = \alpha(x)$ on S . Let

$$H = u(x)F(x, z(x), u).$$

If $u(x)$ is a piecewise smooth minimizing control, then H is maximum when $u = u(x)$.

6973

Optimal programs for an ascending missile.

J. Soc. Indust. Appl. Math. Ser. A Control 2 (1964), 66-88.

An admissible program is defined to be an ordered triple of real-valued functions (v, y, m) defined on an interval $[0, T]$ and satisfying the following: (i) $v(0) = y(0) = 0$; (ii) $v(T) = V$, $y(T) = Y$, $m(T) = M$, where $M > 0$, $Y > 0$, $V \geq 0$ are fixed; (iii) v is in $L^1[0, T]$, m is non-increasing, and $y(t) = \int_0^t v(s) ds$; (iv) if $E(t) = \exp(c^{-1}(v(t) + gt))$, where g and c are positive constants, then, for every t_1, t_2 in $[0, T]$,

$$m(t_1)E(t_1) - m(t_2)E(t_2) + c^{-1} \int_{t_1}^{t_2} L(v(s), y(s))E(s) ds.$$

The following problem is then posed. Does there exist an admissible program (v_0, y_0, m_0) such that if (v, y, m) is any other admissible program, then $m_0(0) \leq m(0)$. If so, what is the program (v_0, y_0, m_0) , and is it unique.

It is shown, under reasonable assumptions about the drag function D , that a unique optimal program exists and has the following characteristics. If there is no drag or if Y is small and the drag is negligible, then the optimal program consists of an initial velocity boost followed by a coast. If for given Y, V is small, then the optimal program consists of an initial boost followed by a propulsive phase and then a coast. For Y and V both large the optimal program consists of an initial boost, a propulsive phase, and a terminal boost.

The proof of existence is accomplished by first showing that only programs whose velocities v are always non-negative need be considered and that the velocity functions v_n in a minimizing sequence are of uniformly bounded variation. The existence then follows from Helly's theorem.

To characterize the solution and show uniqueness, the authors determine the trajectory Γ in (t, y) -space of a coasting program, and show that all other trajectories lie on one side of Γ . The analogue of a field in the calculus of variations is then constructed. By comparing admissible trajectories with trajectories of the field, it is shown that an optimal program must correspond to a unique trajectory of the field.

Sur la réponse transitoire d'un système non linéaire échantillonné régi par une équation aux différences finies d'ordre m .

C. R. Acad. Sci. Paris 256 (1963), 5058-5061.

This brief note concerns a "sampled system" governed by the m th-order difference equation $x_{n+m} + f_1 x_{n+m-1} + \dots + f_m x_n = 0$, where the f_i are functions of x_n, \dots, x_{n+m} and n . The equilibrium point of the system is taken to be the origin. For given initial conditions of the form $|x_1|, |x_2|, \dots, |x_m| = c$, the " b percent response time" is defined to be the shortest time, nT , such that $|x_{n+m}| \leq (b/100)c$. Here T is the "sampling period", i.e., the timestep in the difference equation. It is shown that if the coefficients satisfy the condition $1 - \sum_{i=1}^m |f_i| > d > 0$ with $k \geq 1$, then $|x_{n+k}| \leq k^{-1}|x_n|$, so that the b percent time is given by $bn^d > 100$. Somewhat surprising is the absence of references to the abundant literature on the subject.

6979

The application of the methods of mathematical programming to an optimal control problem. (Russian)

Izv. Akad. Nauk SSSR Tekh. Kibernet. 1964, no. 5, 16-29.

The paper considers the problem of time-optimality in control systems. Mathematical programming methods are used to find the control. The number of variables, the form of the constraints, and the method of solving the obtained problem essentially depend on the way in which the corresponding Cauchy problem is approximated. The cases of piecewise-constant and piecewise-linear approximations are considered in detail. Much attention is paid to the development of algorithms for solving the mathematical programming problems that arise. The usual time-optimal problem for the matrix system $\dot{X} = A(t)X + b(t)u(t)$, $X(0) = X_0$, $|u(t)| \leq 1$, is called Problem \bar{R}_1 . If, in addition, the state variables are bounded, $|x_i(t)| \leq m_i$, $i = 1, \dots, n$, we have Problem \bar{R}_2 . The approach is to minimize the norm of X at fixed instants T (Problems $\bar{R}_1(T)$, $\bar{R}_2(T)$) and then to seek the minimal T for which the norm of X equals zero. The computational difficulties in these problems stem not only from the order of the state equations but also from the form of the integrand function in the Cauchy formula for the formal solution of the state equations. To obviate these difficulties, the integral in the Cauchy formula is approximated by a sum, and the problem reduces to seeking the minimum of a multivariable convex function in a closed region. The corresponding

approximate problems are referred to as Problems $R_1(T)$, $R_2(T)$. A modification of the simplex method is used to solve these problems. The Kuhn-Tucker optimality criterion is also utilized for solving Problem $R_1(T)$. These methods can be extended also to cases of piecewise-parabolic and piecewise-polynomial approximations. A third-order example is considered and solved for both the piecewise-constant and the piecewise-linear approximations.

6981

On the theory of optimal control. Sufficient coordinates. Automat. i Telemekh. 23 (1962), 910-917 (Russian. English summary); translated as Automat. Remote Control 23 (1963), 847-854.

A basic problem in automatic control is the selection of an "optimal" control decision on the basis of what is currently known. Frequently this means making decisions on the basis of the current values of the physical state variables in an effort to minimize the expected value of the future cost. Recently, though, Bellman and Kalaba, Zadeh, and others have emphasized the importance of adaptive control processes, in which the controller's knowledge of the dynamics, objectives, etc., of the process changes in the course of time. This brings with it the attendant problems of describing the controller's state of knowledge and how this changes in the light of experience gained during the process.

An axiomatic treatment is adumbrated, and several interesting examples are provided.

Fattorini, H. O.

6982

Time-optimal control of solutions of operational differential equations.

J. Soc. Indust. Appl. Math. Ser. A Control 2 (1964), 54-59.

Let H be a Hilbert space with norm $\|u\|$, A a linear operator in H , and $f(t)$ a function on $t \geq 0$ into H . The problem considered is this: Given u_0 , v in H , find an admissible control f such that the weak solution of the operational differential equation

$$u'(t) = Au(t) + f(t), \quad t \geq 0,$$

(1)

$$u(0) = u_0,$$

reaches v in the smallest possible time. The definitions are

as follows. Let L_t be the space of functions on $(0, t)$ into H , strongly measurable and bounded, with

$$\text{norm } \|f\|_t = \text{ess sup}(|f(r)|), \quad 0 \leq r \leq t.$$

Let $T(t)$ be the semigroup of bounded operators defined by $T(t)u(0) = u(t)$, where $u(t)$ is the strong solution of the homogeneous equation $u'(t) = Au(t)$. The weak solution of (1) is then defined for f in L_t by

$$u(t) = T(t)u + \int_0^t T(t-r)f(r) dr,$$

integration being in the sense of Bochner. Given u, v in H , an f in L_t is admissible if the weak solution of (1) reaches v at some t_0 and $\|f\|_{t_0} \leq 1, 0 \leq t \leq t_0$; it is optimal if t_0 is minimal.

It is proved that if for u and v in H there exists an admissible control, then there exists an optimal control, and that the optimal control uses the maximum available energy ($\|f(r)\| = 1$ a.e.) and is unique up to sets of measure zero. It is stated that the methods are applicable in wider situations, for example, when H is a reflexive Banach space or $A = A(t)$. No applications are indicated.

Permutation groups, complexes, and rearrangeable connecting networks.

Bell System Tech. J. 43 (1964), 1619-1640.

This paper presents an algebraic and combinatorial approach to the study of rearrangeability in connecting networks. Networks of this type are used in telephone systems, and they consist of arrangements of switches and transmission links through which inlets can be connected to outlets in many combinations. A network is rearrangeable if every assignment of inlets to outlets is realizable. The specific network form considered here is a sequence of switching stages connected by link patterns. A stage realizes a subgroup of the symmetric group of permuta-

tions, and a link pattern realizes a permutation. To obtain rearrangeability, the product of subgroups and permutations defined by the network should yield the symmetric group. Sufficient conditions (in terms of properties of stages and links) under which this is possible are formulated. The author indicates that these conditions do not provide new design principles, but they are intended to give new insights to the problem. A specific class of networks, that are generalizations of those given by Paul (reference provided in the paper), is also described.

The paper is clearly written, and it presents an interesting application of group theory to the design of routing networks. (A minor comment on presentation: unconventional notations for the empty set and the cardinality of a set are introduced on p. 1627 prior to their definition on the next page.) S. ★Introduction to linear systems analysis.

John Wiley and Sons, Inc., New York-London, 1962. xi + 403 pp. \$10.50.

Possibly the only thing that distinguishes this book from many other similar ones on linear system analysis is the inclusion of material on random processes. In Part I, Systems with Explicit Driving Functions, there are ten chapters: (1) Introduction to the Laplace Transform; (2) Translating the Physical Problem into Mathematical Language; (3) More on Laplace Transform Theory; (4) System Concepts; (5) Systems with Feedback; (6) Fourier Transform Analysis; (7) Some General Properties of Physically Realizable Transfer Functions; (8) Distributed-Parameter Systems; (9) Systems with Time-Varying Parameters; (10) The z -Transform. In Part II, Systems with Random Driving Functions, there are five chapters: (11) Essential Notions of Probability; (12) Mathematical Description of a Random Process; (13) The Analysis Problem; (14) Optimization; (15) Further Topics on Optimization. There are two Appendices: (A) Tables of Laplace Transforms; (B) Calculus of Variations and Lagrange's Equations.

The material presented is straightforward and uninspiring, as are the problems at the end of each chapter, and a bit behind the times for the advanced undergraduate or beginning graduate student for whom it is intended.

N. H. Chokey (Silver Spring, Md.)

Doležal, Václav 6988

★Dynamics of linear systems.

Publishing House of the Czechoslovak Academy of Sciences. Prague, 1964. 224 pp. Kcs. 28.00.

In der Netzwerktheorie treten gewisse Schwierigkeiten auf, die von den Elektrotechnikern meist entweder nicht aufgeklärt oder mit illegitimen Mitteln behandelt werden: Die äusseren Erregungen können Sprünge haben, sind also nicht durchweg differenzierbar, oder sie stellen Impulse

dar, die nicht mit dem Funktionsbegriff erfassbar sind; die nach den üblichen Methoden hergestellten Lösungen haben andere als die vorgeschriebenen und bei der Herleitung benutzten Anfangswerte. Der Autor stellt sich die Aufgabe, unter Benützung der Distributionen eine so allgemeine Theorie zu entwickeln, daß solche Widersprüche nicht auftreten und auch die allgemeinsten Erregungen zulässig werden. Das Gleichungssystem der Netzwerktheorie wird in Matrixform geschrieben: $(1) Ax' + Bx + C \int_0^t x(\tau) d\tau = f(t)$ mit den $r \times r$ Matrizen A, B, C und den r -dimensionalen Vektorfunktionen $x(t), f(t)$. Als Anfangsbedingung wird der r -dimensionale konstante Vektor c vorgeschrieben. Das 1. Kapitel verbleibt noch im Rahmen der klassischen Theorie (Funktionen) und sucht einige der genannten Schwierigkeiten dadurch zu beheben, daß statt des Systems (1) das von 0 bis t integrierte System betrachtet wird, in das der Anfangsvektor c eingetreten ist. Bei der Lösung mittels Laplace-Transformation spielt bekanntlich die Matrix $Z^{-1}(p)$, wo $Z(p)$ die Impedanz $Ap + B + Cp^{-1}$ ist, eine wichtige Rolle. Deshalb werden im 2. Kapitel derartige Matrizen auf ihr funktionentheoretisches Verhalten untersucht. Im 3. Kapitel geht der Autor zu seinem eigentlichen Thema, der Behandlung des Systems (1) im Rahmen der Distributionentheorie, über. Dazu werden zunächst die grundlegenden Eigenschaften der Distributionen aus dem Raum D im Sinne von L. Schwartz entwickelt und aus D die Unterklasse D_L von Distributionen abgegrenzt, die Laplace-Transformierte besitzen. Wenn f ein Vektor über D_L ist, so wird der Vektor x über D_L die Distributionallösung des Systems (1) mit der Anfangsbedingung c genannt, wenn x das System $Ax' + Bx + Cx^{(-1)} = f + Ac\delta_0$ befriedigt. (Das Integral $x^{(-1)}$ wird vorher in geeigneter Weise definiert.) Damit wird den in $t=0$ eventuell auftretenden Sprüngen zwischen gegebenen und angenommenen Anfangswerten Rechnung getragen. Das so formulierte Problem hat immer eine Lösung, von der gezeigt wird, daß sie ein zutreffendes Bild der physikalischen Wirklichkeit liefert. Im 4. Kapitel wird an Stelle von (1) das Differentialgleichungssystem $Ax'' + Bx' + Cx = f$ auf der vollen Achse $-\infty < t < \infty$ ohne Transformationstheorie mit Distributionen behandelt, die zu diesem Zweck zu komplexwertigen verallgemeinert werden. Im 5. Kapitel wird das System mit zeitvariablen Koeffizienten

$$(2) \sum_{n=1}^r a_{nm}(t)x_n^{(m)}(t) + \sum_{n=1}^r \int_0^t W_{nn}(t, \tau)x_n(\tau) d\tau = f_i(t) \quad (i = 1, 2, \dots, r)$$

nach einer Operatorenmethode gelöst, die vom Heaviside-Kalkül inspiriert ist. Nach eingehendem Studium des Produktes $[Wx]$ einer Funktion $W(t, \tau)$ von zwei Variablen mit einer Distribution x von endlicher Ordnung wird die Menge \mathcal{W}_n der Operatoren $Ax = [Wx]^{(n)}$ betrachtet. Der in (2) vorkommende Operator $Ax = a_{1n}x^{(n)} + \dots + a_{rn}x' + a_{rn}x + [Wx]$ gehört zu \mathcal{W}_n . Die Lösung von (2) besteht in dem Nachweis der Existenz des inversen Operators A^{-1} . Im 6. Kapitel werden die Eigenschaften von Multipolen, die sonst nur für Systeme mit konstanten elektrischen Elementen (Widerstand, usw.) formuliert werden, auf allgemeine lineare Systeme übertragen, deren Elemente zeitvariabel sein können.

Das Referat kann nur einen kleinen Teil von dem reichen Inhalt des Buches wiedergeben, das einige bisher unbefriedigend behandelte Teile der theoretischen Elektro-

technik auf eine der modernen Analysis entsprechende Basis stellt.

★Les régimes variables dans les systèmes linéaires et non linéaires.

Dunod, Paris, 1962. xvi + 524 pp. 88 NF.

Essentially this is a standard book on linear and nonlinear systems of which many have appeared both in English and in French. It differs from most English books in the prolific use of illustrative diagrams, a typical French textbook characteristic. In an introduction of six pages the author lists the general properties of linear and nonlinear systems and the methods of studying them.

Part I, Linear Systems, contains seven chapters. Chapter 1 introduces the p ($= d/dt$) operator and block diagrams. The author carefully justifies his use of this p operator instead of the more usual complex variable s of the Laplace transform. Electric and mechanical systems are discussed, as are electromechanical analogues. Linearized nonlinear systems are presented. Signal flow graphs are also dealt with in this chapter. Chapter 2 is a standard exposition of the symbolic calculus. Chapter 3 introduces the E operator defined as the delay operator, $Ef(t) = f(t-T)$, which forms the basis of a numerical calculus. Chapter 4 takes up the question of harmonic modes. Chapter 5 discusses the relationship between the transient response and the frequency response. Chapter 6 presents the standard Nyquist and Hurwitz stability criteria, and a new damping criterion based on a new form of the characteristic polynomial. Chapter 7 deals with sampled-data systems with finite pulse-width sampling. Use is made here of the E -transform developed in Chapter 3. There are several places here that a factor of τ , the pulse-width, is omitted from various formulas—notably in equations (7.8), (7.9) and (7.10), and in the seventh, eighth, ninth and tenth rows of the last column of Table 7.2 on page 281.

Part II: Nonlinear Systems, contains three chapters. Chapter 8 extensively discusses various aspects of nonlinear filters. Topological (phase-space) methods are taken up in Chapter 9. The last chapter presents numerical and graphical methods of computing the transient modes of nonlinear systems.

Appendix A presents the Graeffe method for finding the roots of a polynomial equation. Appendix B treats the Fourier series and integral and their use in harmonic analysis. Appendix C is a good discussion of the Laplace transform.

6990

A theory of nonlinear networks. I.

Quart. Appl. Math. 22 (1964), 1-33.

This paper is a new and systematic approach to the study of nonlinear RLC-networks. A network here is an idealized concept defined as a set of nodes and a set of connecting branches; it is also called a graph. The entire report is based on the fact that the system of differential equations for such networks has the form: $(1) L_\rho(dv_\rho/dt) = \partial P/\partial i_\rho$, $C_\sigma(dv_\sigma/dt) = -\partial P/\partial v_\sigma$ ($\rho=1, \dots, r$, $\sigma=r+1, \dots, r+s$), where $P=P(i, v)$ is a function describing the physical properties of the resistive part of the network. Since P has the dimension of voltage times current, it is called a mixed potential function. System (1) seems to form a Hamiltonian system but is not so, since, in distinction to the

latter, it contains dissipative terms. The main difference between linear networks and the networks considered here is that in the latter the voltage-current relations for the resistors may be nonmonotonic, i.e., "negative resistances" may occur. Of course, any or all of the elements may be nonlinear.

The mixed potential function $P(i, v)$ is used to construct Ljapunov-type functions for stability considerations. A procedure for obtaining $P(i, v)$ directly from the network is given. The concepts of a complete set of mixed variables and of a complete circuit are introduced. One of the main purposes of the paper is to draw conclusions on the solutions of system (1) from a consideration of its special forms. System (1) preserves its form under coordinate transformations which leave invariant the indefinite metric: (2) $-\sum_{i=1}^n L_i (di_t)^2 + \sum_{j=1}^m C_j (dv_j)^2$. Special forms of the network, and thus of system (1), occur, for example, if only resistors are present (R-network) or if inductors are absent (RC-network). For such special forms the metric also takes special forms which are studied.

In general, RLC-networks will admit oscillations even in the linear case. The paper derives criteria which rule out self-sustained oscillations in general nonlinear RLC-networks with time-invariant elements.

The set of variables $i_1, \dots, i_r, v_1, \dots, v_{r+m}$ is said to be complete if they can be chosen independently without a violation of Kirchhoff's laws and if they determine in each branch at least one of the two variables, the current or the voltage. The problem is then to determine a complete set of variables for a given graph. The authors show how to solve this problem in several ways, from the voltages and link currents of a maximal tree; a maximal tree is a subgraph not containing any loops and not capable of being enlarged as a tree, and links are branches not contained in the maximal tree. A circuit with a complete set of variables is said to be complete.

Part I ends with an example of an arbitrarily large ladder network containing nonlinear elements. Part I contains the main results without details of proofs and refinements. Part II [6991 below] complements Part I with detailed proofs and with several additional results.

Theorems on the representation of events in Moore automata.

Ann. Univ. Turku. Ser. A I No. 69 (1964), 14 pp.

Bekanntlich (vgl. z.B. V. M. Gluškov [Uspehi Mat. Nauk 16 (1961), no. 5 (101), 3-62; MR 25 #1976]) läßt sich jedes reguläre Ereignis E über einem endlichen Alphabet X in einem passenden endlichen initialen Moore-Automaten mit dem Eingabealphabet X durch eine geeignete Teilmenge S dessen Zustandsmenge A in dem Sinne repräsentieren, daß E aus genau den Wörtern über X besteht, die den Automaten aus seinem Anfangszustand in einen Zustand der Menge S überführen. In der vorliegenden Arbeit werden zunächst für den Fall eines einelementigen Alphabets $X = \{x\}$ Formeln für die minimalen Anzahlen $N_S(E)$ und $N_A(E)$ der Mengen S bzw. A abgeleitet, die für die Repräsentierung eines gegebenen regulären Ereignisses E über $\{x\}$ erforderlich sind. Es wird dazu für die regulären Ereignisse über $\{x\}$ eine Darstellung durch eine eindeutig bestimmte Normalform angegeben, aus der sich die Anzahlen $N_S(E)$ und $N_A(E)$ ablesen lassen. Es wird ferner auch für die regulären Ereignisse über einem beliebigen Alphabet X eine gewisse Art von "Normaldarstellung" hergeleitet (allgemeiner auch für die Ereignisse E , für die $N_S(E) = 1$ ist). Sodann werden hinreichende Bedingungen dafür angegeben, daß für ein reguläres Ereignis E über einem beliebigen Alphabet X , bei gegebenem k , $N_A(E) > k$ gilt, und die eine Verallgemeinerung eines von Bodnaruk [Ukrain. Mat. Z. 14 (1962), 190-191] für den Fall $k=1$ bewiesenen Resultats sind. Schließlich wird bewiesen, daß ein nichtleeres endliches Ereignis E über einem Alphabet X dann und nur dann irreduzibel ist, d.h. $N_A(E) = |E|$ gilt, wenn E von der Form $E = P_1 \vee P_1 P_2 \vee \dots \vee P_1 P_2 \dots P_k$ ist, wobei P_2, \dots, P_k nichtleere Wörter über X sind.

On a method of synthesis of graph-diagrams for algorithms. (Russian)

Dokl. Akad. Nauk BSSR 8 (1964), 568-571.

The authors describe a method by which one can obtain a graph-diagram for certain algorithms which have a specified number of steps and which are originally described by means of characteristic tables. They suggest that the method may be useful in simplifying the programming of certain problems. The method used is similar to a method of Bloh for the synthesis of contact networks (Avtomat. i Telemekh. 23 (1961), 756-764; MR 26 #7473).

6997

On the disparallelization of computing algorithms. (Russian)

Izvid. Sistemy No. 5 (1962), 22-30.

The author defines for the graph $G = (X, I)$ an A -partition as an ordered partition (S_α) of X into nonempty subsets such that (for all α) $I S_\alpha \subset \bigcup_{\beta < \alpha} S_\beta$. The interpretation is that the set X is a collection of operations and that $y I x$ means that the result of the operation x serves as an argument for the operation y . The results deal with the existence of A -partitions of graphs and estimates of minimal length algorithms corresponding to these.

Entwicklungszustand und Perspektiven der Theorie der konkreten und der abstrakten endlichen Automaten.

Mathematische und physikalisch-technische Probleme der Kybernetik, pp. 454-472. Akademie-Verlag, Berlin, 1963.

Es werden Möglichkeiten dargelegt, die abstrakte Automatentheorie auf konkrete Automaten (Schaltungen mit realen Schaltelementen) anzuwenden. Anhand einer Vielzahl von Beispielen wird gezeigt, wie sich die reale Arbeitsweise der verschiedensten Arten von Schaltelementen und damit auch von komplizierten Schaltungen aus solchen Elementen durch kanonische Gleichungen beschreiben lassen, wenn man passende Hilfsvariablen einführt. Damit wird es möglich, die für die Analyse von endlichen abstrakten Automaten entwickelten Methoden unmittelbar zur Analyse von konkreten Automaten zu verwenden. (Bei dem wesentlich wichtigeren Problem der Synthese ist entsprechendes nicht möglich.) Ein umfangreiches Literaturverzeichnis gibt insbesondere einen Überblick über die in Rumänien durchgeführten Arbeiten zu den genannten Fragen.
G. Aaser (Greifswald)

Algorithmische Sprachen und Programmierung von Rechenautomaten.

Mathematische und physikalisch-technische Probleme der Kybernetik, pp. 147-176. Akademie-Verlag, Berlin, 1963.

Es wird über diejenigen algorithmischen Sprachen (Automatensprachen) berichtet, zu denen die praktischen Aufgaben der Programmierung von digitalen Rechenautomaten geführt haben. Dabei werden besonders die allgemeinen logischen Prinzipien der Programmierung herausgearbeitet. Grundlage für diese Betrachtungen bildet eine abstrakte Definition der Rechenautomaten die im gewissen Sinne eine "Verfeinerung" des abstrakten Automatenbegriffs von Huffman, Moore, Mealy, Glushko darstellt, indem nämlich die üblichen Bestimmungsstücke eines abstrakten Automaten zusätzlich so strukturiert werden, wie dies bei realen digitalen Rechenautomaten der Fall ist. Zum Beispiel wird die Menge A der inneren Zustände als Produktmenge der Form $B \times Z' \times I$ angenommen, wobei B, Z, I gegebene abstrakte Mengen sind. Jeder Zustand ist dann ein Tripel (b, z, i) , wobei $b \in B$ der jeweiligen "Betriebszustand" des Rechenautomaten bezeichnet (z.B. Halte- oder Rechenbetrieb), $z \in Z'$ der Zustand der verschiedenen "Zellen" des Automaten beschreibt (Z ist dabei die Menge der Zustände, die die einzelnen Zellen des Automaten annehmen können während die Menge I als Indexmenge für die verschiedenen Zellen dient, d.h. die Adressen symbolisiert) und $i \in I$ die im "Befehlszähler" eingestellte Adresse angibt. Weitere wichtige Bestimmungsstücke sind die "Eingabefunktion" des Automaten, seine "Adressenzahl", sein "Befehlsystem" und zwei Funktionen zur Dekodierung des Zellenzustands, die sämtlich abstrakt festgelegt werden. Dadurch wird es möglich, dem Programmierungsproblem eine ganz abstrakte Fassung zu geben. Der Übergang von einer algorithmischen Sprache zur Programmierungssprache erscheint als ein Übersetzungsproblem, das sich bei bekanntem Übersetzungsalgorithmus unter gewissen Voraussetzungen mittels eines Übersetzungsprogramms (programmierenden Programms) realisieren läßt. Es wird in diesem Zusammenhang die Überzeugung dargelegt, daß die Frage der Existenz einer optimalen algorithmischen Sprache (nach Präzisierung der Gesichtspunkte der Optimalisierung) ein Problem ist, das nur durch eine wissenschaftliche Untersuchung in befriedigender Weise gelöst werden kann. Abschließend werden die Möglichkeiten diskutiert, mit Rechenautomaten auch nicht-numerische Probleme zu lösen.

Petrose, Luigi

7000

Linguaggi algoritmici.

Univ. e Politec. Torino Rend. Sem. Mat. 22 (1962/63), 55-77 (1964).

This is a survey article on some concepts and results that arise from the study of the interconnections between grammars of formal languages and types of automata that serve as generating or as recognition devices for various such languages. The paper reports, in particular, on the results concerning regular and context-free languages.

MATHEMATICAL REVIEWS, University of Michigan, Ann Arbor, Michigan 48103, U.S.A.

Subscription: Price \$50 per volume. There will be two volumes in 1965. Checks should be made payable to the AMERICAN MATHEMATICAL SOCIETY. Subscriptions should be addressed to the American Mathematical Society, P.O. Box 6248, Providence, R.I. 02904, U.S.A.

The preparation of the reviews appearing in this publication is made possible by support provided by a grant from The National Science Foundation. The publication was initiated with funds granted by the Carnegie Corporation of New York, the Rockefeller Foundation, and the American Philosophical Society held at Philadelphia for Promoting Useful Knowledge. These organizations are not, however, the authors, owners, publishers or proprietors of the publication, and are not to be understood as approving by virtue of their grants any of the statements made or views expressed therein. The comments and opinions expressed in reviews of books and other publications are those of the individual reviewers and do not necessarily represent the views of the Editors or the American Mathematical Society.

Mathematical Reviews will be published in two volumes in 1965; each volume will consist of six monthly issues, and a separate index issue will be published for each volume. Reviews and pages are numbered consecutively.

Journal references in Mathematical Reviews are given in the following form: *Rückschritte der Math.* (6) 5 (56) (1960/61), no. 2, 18-53 (1962), where, after the abbreviated title, one has: (series number) volume number (volume number in first series, if given) (nominal date), issue number if necessary, first page—last page (imprint date). If only one date is given, this will usually be interpreted as the nominal date and will be printed immediately after the volume number. If no volume number is given, the year will be used in its place. The symbol ★ precedes the title of a book or other non-periodical which is being reviewed as a whole.

References to reviews in Mathematical Reviews before Volume 20 (1959) are by volume and page number, e.g., MR 15, 122; from Volume 20 on, by volume and review number, e.g., MR 20 #4387 or MR 23 #A123. Reviews reprinted from Applied Mechanics Reviews, Computing Reviews, Mathematics of Computation, Operations Research, Referativnyi Zhurnal Matematika (Mekhanika, etc.), Science Abstracts, or Zentralblatt für Mathematik are identified in parentheses following the reviewer's name by AMR, CR, MC, OR, RZMat (RZMeh, etc.), SA, Zbl, respectively.

TABLE OF CONTENTS FOR VOLUME 29

GENERAL:	1, 217, 413, 637, 877, 1067.
HISTORY AND BIOGRAPHY:	1, 218, 414, 638, 879, 1068.
LOGIC AND FOUNDATIONS:	1, 220, 415, 639, 880, 1069.
SET THEORY:	8, 226, 421, 644, 885, 1072.
COMBINATORIAL ANALYSIS:	6, 227, 421, 647, 885, 1075.
ORDER, LATTICES:	8, 227, 423, 648, 888, 1077.
GENERAL MATHEMATICAL SYSTEMS:	9, 229, 424, 651, 889, 1079.
THEORY OF NUMBERS:	10, 230, 425, 651, 889, 1080.
FIELDS AND POLYNOMIALS:	17, 236, 432, 660, 895, 1088.
ABSTRACT ALGEBRAIC GEOMETRY:	19, 238, 435, 661, 896, 1089.
LINEAR ALGEBRA:	22, 239, 437, 663, 898, 1092.
ASSOCIATIVE RINGS AND ALGEBRAS:	24, 240, 439, 665, 897, 1095.
NON ASSOCIATIVE ALGEBRA:	26, 242, 440, 669, 898, 1099.
HOMOLOGICAL ALGEBRA:	27, 242, 441, 670, 899, 1100.
GROUP THEORY AND GENERALIZATIONS:	27, 244, 441, 672, 900, 1103.
TOPOLOGICAL GROUPS AND LIE THEORY:	35, 252, 447, 683, 908, 1114.
FUNCTIONS OF REAL VARIABLES:	38, 254, 452, 686, 911, 1116.
MEASURE AND INTEGRATION:	39, 255, 455, 688, 913, 1117.
FUNCTIONS OF A COMPLEX VARIABLE:	42, 256, 458, 691, 917, 1121.
POTENTIAL THEORY:	49, 265, 467, 700, 922, 1131.
SEVERAL COMPLEX VARIABLES:	52, 266, 470, 702, 923, 1133.
SPECIAL FUNCTIONS:	54, 268, 471, 704, 925, 1137.
ORDINARY DIFFERENTIAL EQUATIONS:	57, 270, 474, 708, 930, 1140.
PARTIAL DIFFERENTIAL EQUATIONS:	60, 279, 483, 715, 935, 1150.
FINITE DIFFERENCES AND FUNCTIONAL EQUATIONS:	78, 290, 496, 723, 944, 1163.
SEQUENCES, SERIES, SUMMABILITY:	79, 291, 497, 724, 945, 1164.
APPROXIMATIONS AND EXPANSIONS:	81, 292, 500, 726, 947, 1166.
FOURIER ANALYSIS:	83, 293, 502, 729, 950, 1169.
INTEGRAL TRANSFORMS, OPERATIONAL CALCULUS:	87, 298, 508, 733, 954, 1173.
INTEGRAL EQUATIONS:	89, 300, 506, 736, 956, 1174.
FUNCTIONAL ANALYSIS:	91, 302, 509, 737, 958, 1176.
CALCULUS OF VARIATIONS:	102, 312, 521, 750, 969, 1191.
GEOMETRY:	102, 313, 522, 751, 969, 1193.
CONVEX SETS AND GEOMETRIC INEQUALITIES:	104, 315, 527, 756, 973, 1199.
DIFFERENTIAL GEOMETRY:	106, 316, 529, 758, 974, 1200.
GENERAL TOPOLOGY:	115, 322, 537, 768, 981, 1213.
ALGEBRAIC TOPOLOGY:	119, 326, 543, 773, 986, 1216.
TOPOLOGY AND GEOMETRY OF DIFFERENTIABLE MANIFOLDS:	123, 329, 547, 776, 988, 1219.
PROBABILITY:	127, 330, 549, 777, 990, 1221.
STATISTICS:	136, 335, 560, 787, 1000, 1231.
NUMERICAL METHODS:	143, 342, 566, 794, 1008, 1237.
COMPUTING MACHINES:	149, 348, 579, 805, 1015, 1247.
GENERAL APPLIED MATHEMATICS:	350, 580, 806, 1016, 1248.
MECHANICS OF PARTICLES AND SYSTEMS:	150, 351, 581, 806, 1017, 1248.
ELASTICITY, PLASTICITY:	152, 352, 581, 810, 1018, 1249.
FLUID MECHANICS, ACOUSTICS:	162, 357, 587, 821, 1023, 1256.
OPTICS, ELECTROMAGNETIC THEORY, CIRCUITS:	171, 363, 594, 833, 1030, 1266.
CLASSICAL THERMODYNAMICS, HEAT TRANSFER:	176, 366, 596, 834, 1033, 1269.
QUANTUM MECHANICS:	176, 366, 597, 834, 1034, 1269.
STATISTICAL PHYSICS, STRUCTURE OF MATTER:	191, 377, 607, 851, 1040, 1280.
RELATIVITY:	196, 381, 611, 858, 1044, 1284.
ASTRONOMY:	198, 397, 615, 862, 1048, 1287.
GEOPHYSICS:	200, 399, 664, 1049, 1288.
ECONOMICS, OPERATIONS RESEARCH, GAMES:	201, 399, 618, 864, 1049, 1289.
BIOLOGY AND BEHAVIORAL SCIENCES:	206, 401, 621, 866, 1054, 1294.
INFORMATION, COMMUNICATION, CONTROL:	206, 401, 621, 866, 1054, 1294.

Mathematical Reviews

Vol. 29, Index

1965

pp. 1309-1438

AUTHOR INDEX

References are to review numbers; an Errata section may be found at the end of this Index. Collections of papers for which an editor (or editors) is named and which are reviewed as a whole are usually listed under the editor's name; e.g., Vain, G. (Editor). Russian authors are listed under the transliterated spelling of Russian used by Mathematical Reviews (see table at the end of this issue). Surnames consisting of more than one part (e.g., van der Corput, de Alfaro, etc.) are listed under the first capital letter.

A few items without personal authors are listed separately at the end of this Index. A star (*) before a title indicates that the item is a book, while a dagger (†) indicates that reference is made to the item in the Errata section at the end of the Index.

- Aaboe, Aage. 1132: On a Greek qualitative planetary model of the epicyclic variety.
- Aarts, J. M. 3336: The four-color problem.
- Abbott, H. L. 2195: (with Moser, L.) On a combinatorial problem of Erdős and Hajnal.
- Abdel Karim, Rahim Ibrahim Ibrahim. 312: *Über den Resonanzbegriff bei Systemen linearer und nichtlinear gewöhnlicher Differentialgleichungen.
- Abdi, Wasir Hassan. 3351: Application of q -Laplace transform to the solution of certain q -integral equations.
- Abdul Halim, N. 3696: (with Al-Salam, W. A.) A characterization of the Laguerre polynomials.
- Abu, Ryma. 3190: Cluster expansion theory for a system of random long spins.
- Abnera, M. 3440: Construction of the integral equations of the first boundary value problem of the mathematical theory of elasticity for a hemisphere.
- Abhyankar, Shrawan. 312: Remark on Homans and Stone.
- Aban, Alexander. 1233: On the lengths of bases of a finitely generated abelian group. 4730: (with Rinehart, Daryl) Honest subgroups of abelian groups.
- Abonyi, J. 4436: Basic equations of magnetofluid-dynamics in anisotropic media.
- Abrahamson, I. G. 4129: Orthant probabilities for the quadrivariate normal distribution.
- Aburan, B. L. 706: (with Arutjunjan, N. H.) *The torsion of elastic bodies. 4907: (with Arutjunjan, N. H. and Balaban, A. A.) On the compressibility of an elastic sphere with a rigid annular housing.
- Abramowitz, Milton. 4014: (with Stegun, Irene A., co-editor) *Handbook of mathematical functions with formulas, graphs, and mathematical tables.
- Abramson, Morton. 4000: Explicit expressions for a class of permutation problems.
- Abubakar, Iya. 4206: Free vibrations of a transversely isotropic plate.
- Accola, Robert D. M. 3390: On semi-parabolic Riemann surfaces.
- Abaya, B. 3330: Some consequences of "minimal" analyticity and unitarity in field theory. 3389: (with Mayer, Meinhard E.; Schuster, Howard J.; Sudarshan, E. C. G. and Han, M. Y.) Concerning space-time and symmetry groups.
- Ackermann, Wilhelm. 3387: Grundgedanken einer typischen Logik.
- Aczél, J. 3397: Remarks on probable inference. 3931: (with Daróczy, Z.) Über verallgemeinerte quadratische Mittelwerte, die mit Gewichtsfunktionen gebildet sind. 3733: (with Vincze, E.) Über eine gemeinsame Verallgemeinerung zweier Funktionalgleichungen von Jensen.
- Adám, András. 3003: On the repetition-free realization of truth functions by two-terminal graphs. I. 3703: (with Csik, K. and Pollák, G.) Ein Satz über teilweise gerichtete Graphen.
- Adamo, Marco. 4659: Raggi sulla struttura del sistema aritmetico del Regno-Medio egiziano.
- Adams, J. F. 4659: (with Walker, G.) An example in homotopy theory.
- Adamkaja, I. A. 2900: (with Godunov, S. K.) The method of spherical harmonics in the problem of critical parameters.
- Adams, José. 3243: On secondary cohomology operations. 3255: (with Giller, Samuel) Secondary characteristic classes and the immersion problem.
- Adke, S. R. 606: A stochastic population diffusing on a finite interval.
- Adler, A. 4458: Classifying spaces for Kähler metrics. III. The first Chern form and isometric imbeddings in Euclidean spaces.
- Adler, György. 4300: Majoration des tensions dans un corps élastique à l'aide des déplacements superficiels. 4909: Majoration du gradient des solutions de l'équation $\Delta u - au = f$. II.
- Adrianova, L. Ja. 4197: A strict error bound for the integration of differential equations by Störmer's method.
- Agppli, A. 3730: (with Markus, L.) Sur l'équivalence des systèmes différentiels.
- Agan, G. N. 3706: (with Guelinov, A. I.) On the history of the development of mathematical research in Azerbaijan.
- Agalarov, D. G. 4311: Propagation of non-linear visco-elastic waves in rods.
- Agarwal, R. P. 290: A note on evaluation of the integral $\int_0^{\infty} e^{-x} f_n(x) dx$.
- Agmon, Sémuel. 4109: Problèmes mixtes pour les équations hyperboliques d'ordre supérieur.
- Agostinelli, Cataldo. 3503: Forma assoluta spazio-temporale delle equazioni della magnetofluidodinamica. 3923: Alcune considerazioni sul problema dei tre corpi.
- Agarwal, H. 700: A note on omission of variables in multiple regression analysis. 2915: On the bounds of the number of common treatments between blocks of semi-regular group divisible designs.
- Agudo, F. R. Dina. See Dina Agudo, F. R.
- Agul'skii, Rafail. 4734: Application of Dedekind's method to a non-Archimedean ordered field.
- Aguirre-Puente, Jaime. 3523: (with Lafur, Bernard and Bataille, Jean) Étude de la congélation d'une lame plate dont une face est maintenue à température constante, l'autre face étant soumise à une température variable en fonction du temps (problème de Stefan unidimensionnel).
- Aharenov, Y. 314: (with Bohm, D.) Answer to Fock concerning the time-energy indeterminacy relation. 315: (with Bergmann, Peter G. and Lebowitz, Joel L.) Time symmetry in the quantum process of measurement.
- Ahlaser, N. I. = Ahlaser, N. I.
- Ahlaser, N. I. 3073: (with Krein, M.) *Some questions in the theory of moments.
- Ahlars, Lars V. 4080: Extension of quasiconformal mappings from two to three dimensions. 4890: Finitely generated Kleinian groups. 4901: Eine Bemerkung über Fuchsische Gruppen.

- Ahlf, A. C. 1725: A bivariate generalization of Hermite's interpolation formula.
- Ahmad, H. H. 4393: Perturbations of hyperbolic elements.
- Ahmad, M. 5995: On analytical continuation by the partial sums of a power series.
- Ahmad, Z. U. 5651: (with Pati, T.) A new proof of a theorem on the absolute summability factors of Fourier series.
- Ahmedov, K. T. 5653: Particular solutions for a certain class of integro-differential equations.
- Ahmedov, T. K. 234: On the analytic continuation of certain series of Taylor-Dirichlet type. 1305: On series of Taylor-Dirichlet type.
- Ahmedova, A. M. 3712: Asymptotic expansion of eigenfunctions and eigenvalues in problems with a narrow deep potential well.
- Ahuja, G. C. 6722: Boundary layer on a yawed semi-infinite flat plate in converging and diverging flows with suction and injection.
- Ahuzarov, A. M. 6058: (with Tornev, A.) On the solutions of a differential equation.

- Zel'dovich, Ya. B. = Zel'dovich, Ja. B.
- Zelazński, V. B. 4334: An analogue of the Flaman problem for a pre-stressed visco-elastic medium.
- Zelinsker, Anton. 2184: Some arithmetic normal algorithms. 2187: Some algorithm theory and its applicability. 2188: Behandlung logistischer Probleme mit Ziffernrechner.
- Zeller, K. 6237: (with Ehlich, H.) Schwankung von Polynomen zwischen Gitterpunkten. 3469: (with Lorents, G. G.) Summation of sequences and summation of series. 5016: (with Lorents, G. G.) Abschneitelimitierbarkeit und der Satz von Hardy-Bohr.
- Zellner, Arnold. 4130: (with Tiao, George C.) Bayesian analysis of the regression model with autocorrelated errors.
- Zelobenko, D. P. 2330: On the theory of representations of complex and real Lie groups.
- Zeludev, I. S. 1364: Cubic and ultimate groups of complete symmetry.
- Zeman, J. Jay. 4683: Bases for S_4 and $S_{4,2}$ without added axioms.
- Zemlin, O. V. 4307: On the relation between the algorithms for constructing solutions of certain equations of parabolic and elliptic types. 6048: Some remarks on the stability of iteration processes.
- Zeragija, P. K. 1516: Solution of a non-linear integro-differential equation by the method of upper and lower functions.
- Zerner, Martin. 6160: Solutions singulières d'équations aux dérivées partielles.
- Zest, Tina. 4405: Un teorema di media in magnetofluidodinamica derivante dal teorema generalizzato del viriale per una massa fluida di conduttività elettrica infinita soggetta alla propria gravitazione.
- Zhang, Su-cheng = Chang, Su-Cheng.
- Zhdanov, I. S. = Zhdanov, I. S.
- Zhen, Xue-guang = Chew, She-kwan.
- Zhurina, M. I. = Zurina, M. I.
- Ziadat Din, M. 1003: Development of symmetric functional and k -statistics.
- Ziad-Din, M. = Ziad Din, M.
- Zich, Rodolfo. 4400: (with Boella, Mario) Sulla rappresentazione dei campi elettromagnetici in coordinate curvilinee ortogonali. 4400: (with Pozzolo, Vincenzo) Una dimostrazione semplice della formula per il calcolo dell'effetto di piccole perturbazioni geometriche sulla frequenza di risonanza di una cavità.
- Zichichi, A. 4401: (Editor) ★Strong, electromagnetic, and weak interactions.
- Ziegler, Hans. 772: Some extremum principles in irreversible thermodynamics with application to continuum mechanics. 4230: (Editor) ★Kreiselprobleme (Gyrodynamics). 4200: Some limiting cases of non-Newtonian fluids.
- Zhangsheng, H. 6037: On automorphisms of plane groups. 3272: (with Fischmeyer, Jürgen) Über die schwache Konvergenz der Haarschen Masse von Untergruppen.
- Zilberman, F. E. 6075: The variational principle in the theory of Green's functions for inhomogeneous systems.
- Zil'berman, P. E. = Zilberman, P. E.
- Zil'kin, Ja. M. 3040: On the approximate solution of integral equations.
- Ziman, J. M. 3307: ★Principles of the theory of solids.
- Zima, A. B. 3480: (with Vasil'eva, A. B.) Asymptotic behaviour of certain classes of differential equations with a small parameter multiplying the highest derivative.
- Zimmerman, J. B. 4236: Five precision point synthesis of the four-bar function generator.
- Zinger, A. A. 5335: (with Linnik, Ju. V.) Polynomial statistics for a normal law and those related to it.
- Zirilli, Francesco. 4004: Ipersuperficie ricorrenti di uno spazio euclideo.
- Zislin, G. M. 2143: (with Sigalov, A. G.) On the mixed spectrum of certain higher-dimensional differential operators of quantum mechanics.
- Zkaron, Antonio. 4545: Sull'esistenza di una misura invariante. 4504: Sulle misure invarianti, equivalenti ad una misura assegnata. 6161: Sul problema di Niccolotti per le equazioni a derivate parziali.
- Zlatek, František. 6000: Quelques remarques au sujet de l'entropie du tobéque.
- Zlotnickii, Ja. I. 1445: On a theorem of Liouville type.
- Zivogljadov, V. P. 5400: Application of statistical solution theory to control problems with indirect index.
- Zivopancev, F. A. 1963: Some properties of irreversible quantum-mechanical processes. 5533: Non-elastic scattering of nucleons on nuclei and the method of quantum Green's functions.
- Zivov, V. S. 330: On the stability of trajectories.
- Zitádvili, L. V. 419: Some properties of the (C, α) -means of Fourier series and the conjugate trigonometric series.
- Zlatev, I. S. 2158: (with Nikolov, A. V.) Analytic properties of the Feynman amplitude. I.
- Zlotkiewicz, K. 3036: (with Lewandowski, Z.) Variational formulas for functions meromorphic and univalent in the unit disc.
- Złotn, Ś. 27: On a combinatorial problem of K. Zarankiewicz.
- Zolin, A. F. 3044: Solution of boundary problems for the Laplace equation by an interpolation method.
- Zolotarov, V. M. 641: On asymptotically correct constants in sharpenings of the global limit theorem.
- Zolvar, René. 1849: Écoulement hyperonique asymptotique d'un gaz parfait non visqueux, non conducteur de la chaleur sur un obstacle en loi de puissance.
- Zoraki, Henryk. 6052: On the equations describing small deformations superposed on finite deformation.
- Zucker, Francis J. 3110: Current topics in the stochastic theory of radiation.
- Zucker, I. J. 6013: Quantum mechanics of the isotropic three-dimensional anharmonic oscillator.
- Zuckerman, Herbert S. 3450: (with Apotol, Tum M.) On the functional equation $F(m)F(n) = F(m)F(n)/f(m, n)$.
- Zuraviev, Ju. I. 2100: Algorithms with finite memory over disjunctive normal forms. 2170: On a class of functions of the algebra of logic which are not everywhere defined. 2171: On a class of algorithms for choosing an element from a finite set. 2172: On invariant variables of functions of a Boolean algebra which are not defined everywhere. 2174: An estimate of complexity of local algorithms for certain extremal properties on finite sets. 4072: Set-theoretic methods in a Boolean algebra.
- Zurina, M. I. 6009: (with Karamzina, L. N.) ★Tables of the Legendre functions $P_{1/2}, Q_{1/2}$. Part I.
- Zurmhil, Rudolf. 2963: ★Matrizen und ihre technischen Anwendungen.
- Zverevič, E. I. 1843: A boundary-value problem of Carleman type for multiply connected domains. 3048: Boundary-value problems with shift on abstract Riemann surfaces. 4001: A boundary-value problem of Carleman type for multiply connected domains.
- Zwifker, C. 3024: ★The advanced geometry of plane curves and their applications.
- Zygmund, A. 4008: (with Calderón, A. P.) On higher gradients of harmonic functions.
- Zytov, A. A. 5336: The theory of graphs.

SUBJECT CLASSIFICATION

This is a list of headings, with code numbers, under which articles were classified during 1965. The headings in capital letters are essentially identical with those appearing in the 1965 monthly issues.

00. GENERAL

- 00 General mathematics
- 04 Collections of papers
- 20 Bibliographies
- 30 Dictionaries and other reference works
- 40 Reports of meetings
- 50 Methodology and philosophy of mathematics
- Philosophy of science, general

01. HISTORY AND BIOGRAPHY

- 00 Ancient
- 10 India, Far East, Maya, etc.
- 15 Medieval and Renaissance
- 20 17th century
- 25 18th century
- 30 19th century
- 35 20th century
- 40 Contemporary
- 50 Biographies, obituaries, personalia
- 60 Collected or selected works; reprintings or translations of classics
- 70 Source books

02. LOGIC AND FOUNDATIONS

- 10 Formalizing verbal reasoning
- 20 Syntax, semantics, deductibility
- 30 Propositional calculus: two-valued
- 33 Logical calculus: first-order, two-valued (functional calculus)
- 40 Logic, axiomatic set theory, paradoxes
- 50 Many-valued logic, modal logic
- 60 Recursive function theory, Turing computability
- 70 Intuitionism
- 75 Axioms for mathematical systems
- 80 Metatheorems for mathematical systems
- 90 Undecidability, unsolvability in mathematical systems
- 95 Abstract automata theory (see also 94.90)

04. SET THEORY

- 10 Point sets
- 20 Relations
- 30 Transfinite numbers
- 25 Problems of the continuum
- 60 Combinatorial (partitions, etc.)

04. COMBINATORIAL ANALYSIS

- 10 Partitioning, subsets, etc.
- 30 Matrices, magic squares, block designs, configurations
- 30 Factorials, binomial coefficients, polynomials, power series
- 40 Graphs
- 50 Enumeration of graphs

04. ORDER, LATTICES

- 10 Total order
- 20 Partial order
- 30 Lattices
- 40 Modular lattices, continuous geometries
- 50 Distributive lattices
- 60 Boolean algebras and rings
- 70 Boolean algebras with operators

04. GENERAL MATHEMATICAL SYSTEMS

10. THEORY OF NUMBERS

- 005 Tables
- 01 Elementary
- 05 Power residues and reciprocity laws, primitive roots, indians; general binomial congruences
- 10 Diophantine equations
- 20 Diophantine approximation
- 25 Continued fractions and other expansions
- 25 Irrationality, transcendence
- 30 Forms
- 40 Geometry of numbers
- 50 Exponential and power sums
- 54 Turán's method
- 55 Modular and automorphic functions, forms, and groups
- 60 Multiplicative asymptotic theory
- 62 Zeta-function and other Dirichlet series
- 64 Character sums, asymptotic theory
- 65 Distribution of primes
- 70 Additive asymptotic theory
- 75 Sequences of integers (additive bases, density theorems, etc.)
- 80 Probabilistic number theory
- 83 Distribution mod 1
- 85 Arithmetic of hypercomplex numbers
- 90 Algebraic number theory
- 95 Class field theory
- 95 Algebraic function fields
- 97 p -adic fields
- 98 Finite fields

12. FIELDS AND POLYNOMIALS

- 30 Finite fields
- 30 Polynomials
- 40 Galois theory
- 50 Algebraic number fields
- 60 Algebraic function fields
- 70 Valuations, topological fields
- 80 Differential and difference algebra

14. ABSTRACT ALGEBRAIC GEOMETRY (for classical algebraic geometry, see 50.00)

- 10 Theories of equivalence
- 15 Transformations and correspondences
- 20 Curves
- 35 Algebraic properties of function fields
- 40 Arithmetical properties of varieties
- 45 Algebraic geometry over special fields or over rings; rationality questions
- 50 Group varieties, abstract analytic groups
- 55 Abstract derivations and differentials
- 55 Sheaf-theoretic and homological methods
- 60 Birational invariants, genera, etc.

15. LINEAR ALGEBRA

- 05 Vector spaces
- 15 Linear inequalities
- 20 Inequalities involving eigenvalues and eigenvectors
- 25 Miscellaneous inequalities involving matrices
- 30 Eigenvalues and eigenvectors
- 35 Canonical forms, reductions
- 35 Linear sets of linear transformations
- 35 Matrix equations and identities
- 35 Invariants

SUBJECT CLASSIFICATION

- 40 Multilinear algebra
 - 45 Determinants
 - 49 Permanents
 - 50 Linear equations, matrix inversion
16. ASSOCIATIVE RINGS AND ALGEBRAS
 - 10 Ideal theory
 - 15 Commutative ideal theory
 - 20 General commutative theory
 - 24 Polynomials
 - 26 Formal power series
 - 28 Local rings
 - 30 Division rings, simple rings and algebras
 - 35 Structure of rings
 - 40 Radical theory
 - 45 Rings with chain condition
 - 50 Linear representations of rings and algebras (including orders)
 - 60 Modules
 - 70 Galois theory
 - 80 Ordered rings
 - 90 Topological rings
 - 95 Semi-rings, etc.
17. NON-ASSOCIATIVE RINGS AND ALGEBRAS
18. HOMOLOGICAL ALGEBRA
20. GROUP THEORY AND GENERALIZATIONS
 - 10 Free groups, relations
 - 14 General products of groups
 - 16 Group extensions
 - 20 Permutation groups
 - 25 Finite groups (including finite abelian)
 - 28 Burnside problem, conditions for finiteness
 - 30 Abelian groups, general theory
 - 40 Nilpotent, solvable, p -groups
 - 45 Groups with local properties
 - 50 Lattices of subgroups
 - 55 Special subgroups
 - 60 Crystallographic and discrete geometric groups
 - 65 Modular groups, discrete subgroups of classical groups
 - 70 Classical groups
 - 75 Linear groups, general
 - 80 Representations, characters, group algebras
 - 85 Representations of symmetric groups
 - 88 Automorphisms and endomorphisms, groups with operators
 - 90 Ordered groups, ordered semigroups
 - 92 Semigroups
 - 94 Groupoids
 - 96 Quasigroups
 - 98 Loops
22. TOPOLOGICAL GROUPS AND LIE THEORY
 - 10 Topological groups
 - 12 Haar measures
 - 15 Topological algebras
 - 40 Transformation groups
 - 50 Lie groups
 - 65 Classical groups
 - 80 Representations and analysis
 - 70 Homogeneous spaces (topology, differential geometry)
 - 90 Lie algebras
 - 90 Abstract Lie theory
 - 95 Infinite Lie groups
 - 99 Lie theory of differential equations
26. FUNCTIONS OF REAL VARIABLES
 - 10 Foundations: limits and generalizations (elementary topology of the line (or plane) if used for real variables)
 - 20 Calculus: elementary, advanced, etc.
- 21 Elementary functions
- 30 Continuity and related questions (modulus of continuity (if not used in boundary behaviour of analytic functions), discontinuities, etc.)
- 40 Differentiation: general theory
- 41 Non-differentiability (non-differentiable functions, points of non-differentiability), discontinuous derivatives
- 43 Generalized derivatives, derivatives of fractional order
- 47 Mean-value theorems
- 50 Monotonic functions, general
- 51 Functions of bounded variation; absolute continuity
- 53 Convexity; generalizations
- 53 Generalized monotonic functions
- 55 Several variables, implicit function theorems, Jacobians
- 55 Transformations with several variables
- 58 Length, area, volume
- 60 Polynomials
- 70 Inequalities (of a general and miscellaneous character)
- 80 Real-analytic functions
- 81 Quasi-analytic classes of real functions, functions of class C^∞
- 85 Superposition of functions
28. MEASURE AND INTEGRATION
 - 10 Measurable sets, general: Borel fields, non-measurable sets
 - 12 Analytic and Suslin sets
 - 13 Finitely additive set functions, measures; generalizations
 - 15 Special and generalized measures, Carathéodory theory of measure
 - 17 Transfinite diameter and capacity. Hausdorff measures and capacities
 - 20 Measurable and non-measurable functions
 - 25 Integration, general
 - 26 Riemann integral, Lebesgue integral, Denjoy integral, etc.
 - 30 Measure-preserving transformations
 - 31 Invariant measures
 - 32 Ergodic theorems
 - 33 Dynamical systems
 - 40 Length, area, volume
 - 41 Other geometric measure theory
30. FUNCTIONS OF A COMPLEX VARIABLE
 - 01 General questions, foundations
 - 02 Monogenic properties of complex functions (also polyanalytic and aperiodic monogenic functions)
 - 09 Inequalities in the complex domain
 - 10 Polynomials
 - 11 Zeros of polynomials
 - 20 Power series
 - 21 Behavior on the boundary of convergence. Overconvergence
 - 24 Dirichlet series
 - 25 Continued fractions
 - 28 Analytic continuation
 - 30 Sequences and series of analytic functions; uniform convergence, normal families, normal functions
 - 35 Integration; integral representations; Cauchy integral. Poisson and Poisson-Stieltjes integrals
 - 36 Moment problems; interpolation problem
 - 40 Conformal mapping, general theory
 - 41 Capacity, harmonic measure
 - 42 Univalent and p -valent functions
 - 43 Coefficient problems
 - 45 Riemann surfaces, uniformization
 - 46 Algebraic functions, Abelian integrals
 - 47 Quasiconformal mapping
 - 49 Automorphic functions and modular functions
 - 50 Maximum principle. Schwarz's lemma, Phragmén-Lindelöf theorems
 - 53 Extremal problems in complex domain
 - 55 Entire functions
 - 60 Meromorphic functions, general theory

SUBJECT CLASSIFICATION

- 61 Distribution of values, Picard-type theorems, Nevanlinna theory, defect (deficiency) theory
 - 62 Theory of cluster sets, prime ends, boundary behavior
 - 63 Bounded functions, positive real part, Blaschke products
 - 64 Bounded mean modulus, bounded characteristic
 - 67 H_p classes and other restrictions
 - 70 Approximation by polynomials and rational functions, Faber polynomials
 - 75 Boundary-value problems, Dirichlet problem
 - 77 Special boundary-value problems; Riemann-Hilbert problem. Inverse boundary problems
 - 79 Algebraic functions
 - 80 Topological function theory, functions topologically equivalent to analytic mappings
 - 81 Generalized analytic mappings. Pseudo-analytic functions of Bers, Vekua, etc.
 - 83 Functions of hypercomplex variables and generalized variables
 - 84 Spaces of analytic functions
 - 86 Kernel function and applications
 - 87 Algebras of analytic functions
31. POTENTIAL THEORY
- 10 Harmonic functions in the plane
 - 11 Harmonic functions, general
 - 15 Subharmonic, superharmonic functions
 - 30 Boundary-value problems, Dirichlet problem
 - 31 Capacity and harmonic measure
 - 33 Generalized capacity and potential
 - 36 Biharmonic and polyharmonic functions and equations
 - 38 Poisson's equation
32. SEVERAL COMPLEX VARIABLES
- 03 Foundations, general questions
 - 10 Multiple power series, formal theory
 - 15 Analytic and meromorphic curves
 - 30 Holomorphic mappings, domains of holomorphy, analytic spaces (see also 57.00)
 - 35 Automorphic functions
 - 36 Approximation theorems
33. SPECIAL FUNCTIONS
- 04 Number-theoretic functions, special sequences
 - 06 Tables of special functions
 - 10 Exponential and trigonometric functions
 - 15 Gamma and Beta functions
 - 17 Error function, probability integral
 - 19 Elliptic functions and integrals
 - 20 Hypergeometric functions
 - 31 B -functions
 - 35 Cylindrical functions; Bessel functions
 - 37 Spherical functions; Legendre polynomials and functions, spherical harmonics, ultraspherical polynomials
 - 38 Lamé, Mathieu, spheroidal wave functions
 - 39 Wave functions
 - 33 Gegenbauer functions
 - 40 Orthogonal polynomials, general (Chebyshev, Hermite, Jacobi, Laguerre polynomials and functions)
34. ORDINARY DIFFERENTIAL EQUATIONS
- 02 Solutions in closed form; integration by quadratures; reduction of differential equations
 - 03 Operational calculus
 - 04 General existence and uniqueness theorems, Picard approximations and generalizations
 - 07 Continuous dependence of solution on parameter
 - 10 Analytic theory
 - 20 Linear equations and systems, general coefficients
 - 21 Linear equations with constant coefficients
 - 22 Linear equations with periodic and almost periodic coefficients
 - 30 Boundary-value problems, linear equations
 - 31 Sturm-Liouville theory
 - 33 Eigenvalues, eigenfunctions
 - 33 Eigenfunction expansions
 - 34 Asymptotic properties of eigenfunctions
 - 36 Boundary-value problems, non-linear
 - 40 Qualitative theory of first- and second-order equations and systems; singular points and limit cycles
 - 41 Periodic and almost periodic solutions
 - 42 Non-linear oscillations
 - 43 Stability of first- and second-order equations and systems
 - 50 Qualitative theory of equations and systems of order greater than 2; asymptotic behavior of solutions
 - 51 Stability; periodic and almost periodic solutions
 - 53 Perturbations
 - 54 Singular perturbations; small parameter with highest derivative
 - 60 Stochastic differential equations
 - 65 Dynamical systems, systems on manifolds
 - 70 Equations and systems of infinite order
 - 75 Difference-differential equations
 - 78 Solution by finite differences
 - 80 Differential equations in Banach and other spaces
 - 85 Optimal control problems
35. PARTIAL DIFFERENTIAL EQUATIONS
- 05 General properties of solutions, Cauchy-Kowalewski theorems, etc.
 - 10 First-order equations and systems
 - 12 Classification of equations and systems
 - 13 Exact equations and integrable systems. Pfaffian equations
 - 15 Characteristics
 - 20 Separation of variables, elementary properties of the equations of mathematical physics
 - 30 Elliptic equations and systems of first and second order
 - 31 Strongly elliptic systems
 - 32 Quasi-linear elliptic equations and systems
 - 33 Schrödinger equation, wave equation
 - 34 Maxwell's equations, Helmholtz equation
 - 35 Spectral analysis, eigenfunctions, operators
 - 36 Elliptic systems and equations of higher order
 - 37 Biharmonic equation
 - 40 Hyperbolic equations and systems of second order
 - 41 Quasi-linear hyperbolic systems and equations of second order
 - 45 Hyperbolic equations and systems of higher order
 - Parabolic equations of second order
 - 55 Equations of mixed type and second order
 - Mixed type, order higher than two
 - Non-linear equations and systems
 - 63 Approximation of solutions
 - Solution by finite differences
 - 65 Special equations: Navier-Stokes, etc.
 - 70 Asymptotic properties
 - 75 Infinite systems, equations of infinite order
 - Equations in Banach spaces and other spaces
36. FINITE DIFFERENCES AND FUNCTIONAL EQUATIONS
- 10 Finite differences, general
 - 12 Solution of ordinary differential equations by finite differences
 - 13 Solution of partial differential equations by finite differences
 - 20 Difference equations
 - 30 Functional equations
40. SEQUENCES, SERIES, SUMMABILITY
- 10 Series and sequences of numbers, general
 - 11 Infinite products
 - 12 Continued fractions
 - 13 Convergence
 - 15 Multiple series and sequences
 - 20 Sequences and series of functions, convergence
 - 30 Summability, general methods
 - 31 Summability, matrix methods
 - 33 Cesàro summability

- 23 Abel, Poisson summability
- 24 Summability of double series
- 40 Convergence and summability of integrals
- 43 Tauberian theorems
- 61. APPROXIMATIONS AND EXPANSIONS
 - 10 Interpolation
 - 15 Polynomial approximation
 - 17 Approximation by rational functions
 - 20 Approximate quadratures
 - 40 Rate of convergence, degree of approximation, best approximation
 - 41 Constructive theory of functions
 - 45 Approximation by smoothing integrals
 - 50 Asymptotic approximations
 - 55 Other methods of approximation
- 62. FOURIER ANALYSIS
 - 05 Trigonometric polynomials
 - 06 Best approximation by trigonometric polynomials
 - 08 Trigonometric interpolation
 - 10 Fourier coefficients
 - 11 Convergence of Fourier series
 - 15 Orthogonal functions
 - 18 Expansions in orthogonal functions
 - 17 Completeness of sets of orthogonal functions
 - 18 Completeness, closure, spectral synthesis
 - 20 Summability of Fourier and generalized Fourier expansions
 - 25 Fourier transform
 - 26 Other Fourier-type transforms
 - 27 Trigonometric moment problems
 - 30 Almost periodic functions
 - 35 Positive definite functions
 - 40 Multiple Fourier series and integrals
 - 50 Abstract harmonic analysis
- 44. INTEGRAL TRANSFORMS, OPERATIONAL CALCULUS
 - 10 Laplace transform
 - 25 Convolution
 - 26 General transforms
 - 30 Special transforms: Legendre, Hilbert, etc.
 - 23 Multiple transforms
 - 40 Operational calculus
 - 43 Operational calculus in several variables
 - 50 Fractional derivatives and integrals
 - 60 Moment problems
- 65. INTEGRAL EQUATIONS
 - 10 Linear integral equations, general
 - 11 Fredholm equations
 - 12 Eigenvalue problems
 - 13 Volterra equations
 - 15 Singular equations
 - 20 Systems of linear equations
 - 30 Non-linear integral equations
 - 31 Singular non-linear equations
 - 40 Integro-differential equations
- 66. FUNCTIONAL ANALYSIS
 - 10 Topological linear spaces (including normed spaces and Hilbert spaces)
 - 30 Partially ordered linear spaces
 - 30 Special function spaces
 - 40 Distributions
 - 50 Single linear operators in linear or partially ordered spaces
 - 60 Groups or semigroups of linear operators, representations of topological groups
 - 65 Rings of operators, group algebras, abstract topological algebras, and their representations
 - 70 Banach algebras of analytic functions
 - 80 Differential and integral operators
 - 90 Applications of functional analysis

49. CALCULUS OF VARIATIONS

50. GEOMETRY

- 05 Foundations
- 10 Euclidean
- 11 Triangles, tetrahedra
- 12 Circles, spheres
- 14 Constructions
- 15 Descriptive geometry
- 17 Analytic geometry
- 20 Affine geometry, general
- 25 Transformations
- 30 Projective geometry, general
- 35 Transformations
- 38 Second-order loci
- 40 Non-Euclidean geometry (i.e., hyperbolic or elliptic)
- 45 Minkowski geometry
- 48 Special geometries
- 50 Classical algebraic geometry
- 51 Foundations
- 62 Transformations
- 65 Curves
- 66 Surfaces
- 67 Abelian varieties, genera, integrals
- 69 Finite geometries
- 70 Projective planes
- 80 Configurations
- 90 Regular figures, divisions of space
- 95 Paradoxical decompositions

63. CONVEX SETS AND GEOMETRIC INEQUALITIES

- 10 Convex polyhedra
- 25 Convex curves
- 30 Convex regions
- 34 Helly-type theorems
- 40 Extremum problems and geometric inequalities
- 45 Packing and covering
- 50 Distance geometries

63. DIFFERENTIAL GEOMETRY

- 01 Curves and surfaces in Euclidean spaces
- 04 Minimal surfaces
- 10 Affine differential geometry
- 20 Projective differential geometry
- 25 Conformal differential geometry
- 30 Non-Euclidean differential geometry
- 33 Other special differential geometries
- 35 Vector and tensor analysis
- 38 Spinor analysis
- 40 Differentiable manifolds (general theory), e.g., definitions, jets, tangent bundles
- 43 Differential invariants (local theory); geometric objects
- 45 Differential calculus (global theory); forms, currents, integration, tensor fields, etc.
- 50 Connections (general theory), including G -structures
- 55 Affine connections
- 60 Projective connections
- 65 Conformal connections
- 70 Local Riemannian geometry
- 72 Riemannian manifolds
- 75 Global surface theory (convex surfaces)
- 78 Lorentz metrics and generalizations
- 80 Kählerian connections and generalizations
- 83 Finsler spaces and generalizations (areal metrics)
- 90 Integral geometry
- 95 Other generalizations (G -spaces of Busemann, etc.)

54. GENERAL TOPOLOGY

- 10 Axiomatic; generalizations of topological spaces
- 20 General topological spaces
- 21 Convergence notions

SUBJECT CLASSIFICATION

- 23 Compactness and generalizations
 - 24 Compactifications, other extensions
 - 25 Proximity spaces
 - 26 Uniform spaces
 - 27 Metric spaces, metrizability
 - 28 Dimension theory
 - 29 Mappings
 - 30 Many-valued mappings
 - 31 Continuous
 - 32 Topological semigroups, lattices, etc.
 - 40 Topology of S_n , 2-manifolds
 - 50 Topology of E_n , n -manifolds ($n > 2$)
 - 60 Transformation groups
 - 70 Topological dynamics
 - 80 Fixed-point theorems, coincidence theorems, etc.
55. ALGEBRAIC TOPOLOGY
- 10 Graphs, map-coloring
 - 20 Knots, links
 - 30 Homology and cohomology theory
 - 32 Sheaves
 - 33 Cohomology (and homology) operations, Steenrod algebra
 - 34 Periodic transformations, fixed points, coincidences (Smith theory)
 - 38 Dimension theory
 - 40 Homotopy theory, general
 - 42 Algebra of mappings (including cohomotopy groups)
 - 45 Computation of homotopy groups
 - 50 Fiber spaces
 - 52 Spectral sequences
 - 60 Manifolds
 - 62 Classification
 - 64 Mappings
 - 66 Generalized manifolds, local homology
 - 68 Homotopy manifolds
 - 70 Imbedding, immersion
57. TOPOLOGY AND GEOMETRY OF DIFFERENTIABLE MANIFOLDS
- 10 Differentiable structures, cobordism
 - 20 Differentiable mappings, imbeddings, immersions, diffeomorphisms
 - 30 Fiber bundles, tangent bundles
 - 32 Characteristic classes
 - 34 Topology of vector and tensor fields
 - 36 Foliations
 - 40 Topology of Lie groups
 - 42 Topology of homogeneous spaces
 - 50 Analysis on differentiable manifolds
 - 60 Complex manifolds (also in several complex variables)
 - 70 Infinite Lie groups, deformations
60. PROBABILITY
- 05 Foundations
 - 10 Combinatorial probability theory
 - 15 Geometric probability theory
 - 20 Distributions
 - 30 Limit theorems
 - 40 Stochastic processes, general theory
 - 45 Markov processes
 - 48 Branching processes
 - 50 Stationary processes
 - 55 Random walks, Brownian motion
 - 60 Queueing theory, telephone traffic, storage
 - 63 Renewal theory
 - 65 Other special processes
 - 70 Random noise
 - 80 Other applications
62. STATISTICS
- 05 Elementary descriptive statistics
 - 10 Distributions of statistical functions
 - 20 Estimation theory: parametric case
 - 25 Testing of hypotheses: parametric case
 - 30 Multivariate analysis, regression analysis
 - 35 Order statistics
 - 40 Non-parametric methods
 - 50 Analysis of experiments
 - 55 Design of experiments
 - 60 Decision theory
 - 65 Multistage decision procedures, sequential analysis
 - 70 Statistical engineering, quality control
 - 75 Life testing
 - 80 Sampling surveys
 - 85 Statistical analysis of stochastic processes, time series analysis
 - 90 Applications
65. NUMERICAL METHODS
- 05 General mathematical methods, iteration, tables
 - 15 Monte Carlo methods
 - 20 Interpolation, smoothing, least squares, curve fitting, approximation of functions
 - 25 Computation of special functions, series, integrals
 - 30 Mathematical programming
 - 33 Linear equations, determinants, matrices
 - 40 Eigenvalues, eigenvectors, Rayleigh-Ritz method
 - 50 Solution of algebraic and transcendental equations and systems
 - 55 Numerical differentiation and integration, mechanical quadrature
 - 60 Ordinary differential equations
 - 65 Partial differential equations
 - 70 Difference and functional equations
 - 75 Integral and integro-differential equations
 - 80 Error analysis
 - 85 Graphical methods, nomography
 - 90 Harmonic analysis and synthesis
68. COMPUTING MACHINES
69. GENERAL APPLIED MATHEMATICS
70. MECHANICS OF PARTICLES AND SYSTEMS
- 10 Foundations
 - 20 Statics
 - 30 Kinematics, mechanisms, linkages
 - 40 Dynamics
 - 50 Oscillations, stability
 - 55 Non-linear oscillation
 - 60 Exterior ballistics
 - 70 Variable mass, rockets
73. ELASTICITY, PLASTICITY
- 05 Foundations of mechanics of deformable solids
 - 06 Elasticity: general theorems
 - 07 Finite deformation
 - 10 Plane stress and strain
 - 15 Three-dimensional problems
 - 25 Beams and rods
 - 30 Plates
 - 32 Shells and membranes
 - 35 Anisotropic bodies
 - 37 Dislocation theory
 - 45 Vibrations, structural dynamics
 - 47 Aeroelasticity
 - 50 Stability, buckling, failure
 - 55 Wave propagation, impact
 - 65 Visco-elasticity
 - 70 Plasticity, creep
 - 80 Soil mechanics
 - 90 Thermo-mechanics

SUBJECT CLASSIFICATION

76. FLUID MECHANICS, ACOUSTICS

- 05 Foundations
- 10 Incompressible fluids: general theory
- 15 Incompressible fluids with special boundaries
- 17 Airfoil theory
- 20 Free surface flows, water waves, jets, wakes
- 25 Viscous fluids
- 30 Boundary layer theory
- 35 Stability of flow
- 37 Convection
- 40 Turbulence
- 45 Rarefied gas flow
- 50 Compressible fluids: general theory
- 55 Compressible fluids: subsonic flow
- 60 Compressible fluids: transonic flow
- 65 Compressible fluids: supersonic and hypersonic flow
- 70 Shock waves
- 75 Aero- and hydrodynamic sound
- 80 Acoustics
- 85 Non-Newtonian fluids
- 90 Magnetohydro- and aerodynamics, ionized gas flow (see also 78.30 ; 82.25 ; 85.60)
- 92 Quantum hydrodynamics
- 93 Relativistic hydrodynamics
- 95 Diffusion, filtration

78. OPTICS, ELECTROMAGNETIC THEORY, CIRCUITS

- 05 Geometric optics
- 10 Physical optics
- 20 Electron optics
- 30 Space charge waves
- 40 Electromagnetic theory
- 45 Electro- and magnetostatics
- 50 Waves and radiation
- 60 Diffraction, scattering
- 70 Antennas, wave-guides
- 80 Circuits, networks (for switching theory, see 94.70)
- 90 Technical applications

80. CLASSICAL THERMODYNAMICS, HEAT TRANSFER

- 10 Classical thermodynamics
- 20 Heat and mass transfer
- 30 Combustion, interior ballistics
- 40 Chemical kinetics

81. QUANTUM MECHANICS

- 10 General theory
- 15 Scattering theory
- 20 Mathematical field theory
- 23 Dispersion relations
- 24 Weak interactions
- 26 Elementary particles
- 28 Nuclear physics
- 30 Atomic physics
- 38 Molecular physics
- 50 Quantum mechanics of many-body systems
- 60 Superconductivity and superfluidity
- 70 Quantum statistical mechanics

82. STATISTICAL PHYSICS, STRUCTURE OF MATTER

- 05 General statistical mechanics
- 10 Quantum statistical mechanics
- 15 Statistical thermodynamics
- 17 Irreversible thermodynamics
- 20 Kinetic theory of gases
- 25 Plasma (see also 76.90)
- 30 Liquids
- 40 Solids
- 45 Crystals
- 50 Metals

- 80 Transport processes
- 85 Nuclear reactor theory

83. RELATIVITY

- 10 Special relativity
- 20 General relativity
- 30 Unified field theories
- 40 Other relativistic theories

85. ASTRONOMY

- 10 Celestial mechanics
- 15 Galactic and stellar dynamics
- 20 3- and n-body problems
- 27 Astronautics
- 30 Stellar structure
- 40 Stellar atmospheres, radiative transfer
- 50 Hydrodynamic and hydromagnetic problems
- 60 Statistical astronomy
- 70 Cosmology
- 80 Special problems
- 90 Radio astronomy

86. GEOPHYSICS

- 10 Hydrology, hydrography, oceanography
- 20 Meteorology
- 30 Seismology
- 40 Potentials, prospecting
- 50 Geo-electricity and magnetism
- 60 Geodetic, mapping problems
- 70 Atmospheric physics

90. ECONOMICS, OPERATIONS RESEARCH, GAMES

- 05 Decisions, utility
- 10 Economic models
- 15 Economic time-series analysis
- 17 Miscellaneous applications to economics
- 30 Management science, operations research
- 35 Highway traffic
- 40 Actuarial theory
- 50 Linear programming
- 52 Transportation problems
- 54 Flows in networks
- 56 Integer programming
- 58 Non-linear programming
- 60 Logistics, inventory, storage
- 70 Games

92. BIOLOGY AND BEHAVIORAL SCIENCES

- 10 Biology
- 20 Genetics
- 30 Population dynamics, epidemiology
- 40 Sociology
- 50 Psychology
- 55 Nervous networks

94. INFORMATION, COMMUNICATION, CONTROL

- 05 Foundations, coding theorems
- 10 Statistical theory of communication channels, filters
- 13 Detection
- 18 Codes, decoding
- 20 Data processing
- 30 Linguistics, machine translation
- 55 Control systems
- 57 Stability of control systems
- 60 Optimal control
- 65 Random control
- 70 Switching theory, relays
- 80 Servomechanisms
- 90 Automata (see also 92.95)

ABBREVIATIONS OF NAMES OF JOURNALS

This list gives the form of references used in MATHEMATICAL REVIEWS and the complete title; the place of publication and other pertinent information are given in parentheses when desirable for clarity.

- Abh. Abnd. Wiss. Göttingen Math.-Phys. Kl.* Abhandlungen der Akademie der Wissenschaften in Göttingen. Mathematisch-Physikalische Klasse. (Göttingen)

ERRATA AND ADDENDA

VOLUME 22

#2976: Landsberg, Max

In lines 1 and 2, the name "Condry" should be replaced by "Cauchy".

VOLUME 26

#2918: Zylbertrest, S.

In connection with the last sentence of the first paragraph of the review, the reviewer calls attention to a paper of R. Raghavendran [Math. Student 28 (1960), 65-70; MR 26 #2917].

Wightman, A. S.

On p. 1514 of the Index issue the review numbered 1339 should be 7339.

VOLUME 27

#5867: Teleman, Silviu

The reviewer adds the following correction. The algebra $C^*(\Sigma_4)$ is isomorphic (as a Banach algebra) to $C_{\pi}(G)$ as discussed, for example, in (19.23.b) of Hewitt and Ross, *Abstract harmonic analysis*, Vol. I: *Structure of topological groups. Integration theory, group representations* [Academic Press, New York, 1963; MR 28 #158]. Thus, contrary to a statement in the review, $C^*(\Sigma_4)$ need not be commutative even if G is [op. cit., (19.24.b)].

Newman, Morris

On p. 1338 of the Index issue, review #2551 should be attributed to Michael F. Newman.

VOLUME 28

#2545: Gray, John W.

The correct bibliographical reference in the heading should be *Topology* 3 (1965), 1-18.

#2554: Raymond, Frank

The correct bibliographical reference in the heading should be *Topology* 3 (1965), 43-57.

#2937: Barbaschin, E. A.; Tabueva, V. A.

The reviewer wishes to replace the first sentence of the review by the following. "The system studied in the authors' earlier paper [Avtomat. i Telemekh. 23 (1962), 1290-1297; MR 27 #6649] is again considered; the notation used below will be that of the review [MR 27 #6649] of the earlier paper. Assume that $A = B^2 - aB + b > 0$, $B > 0$."

#4713: Totari, G. A.

The title of the journal should be completed by *Fiz. Tehn. Zinditny Ser.*

#4974: Mucenicks, V. A.; Rastrigin, L. A.

The title of the journal should be completed by *Fiz. Tehn. Zinditny Ser.*

#5063: Kolchin, E. R.

The correct bibliographical reference in the heading should be *Topology* 3 (1965), suppl. 2, 309-318.

#5402: Tabata, Morio

The author's name should read Obata, Morio.

Tabata, Morio

On p. 1210 of the Index issue, the author's name should read Obata, Morio.

#196: Kobayashi, Shoshichi; Nagano, Tadashi

In line 3 of the review, replace (1906) by (1909).

#618: Hilton, P. J.

The correct bibliographical reference in the heading should be *Topology* 3 (1965), suppl. 2, 161-176.

#656: Georgiou, P.

The reviewer wishes to change "... of B) ..." in line 8 from the bottom of the review to "... of the boundary of B) ...".

#827: Green, A. E.

The reviewer wishes his comment at the end of the review to read as follows. "In the reviewer's opinion, equation (2) above is not at least unjustified. The utility of the author's continuum theory of anisotropic fluids will better wait till some specific problems are solved using that theory. It is too early to decide."

#1229: Taft, Earl J.

The author communicates that, although the hypotheses for the existence result are stated correctly, the hypotheses for the conjugacy result are too stringent; all that one needs is that G be completely reducible and that the characteristic not be 2.

#1248: Mendelsohn, N. S.

The author points out that the proof of Lemma 1 on p. 512 is incorrect, but that it can be rectified. A corrected version will appear in the same journal.

#1581: Coxeter, H. S. M.

In line 4 of the review, the expression $2f_{n-1}(x)/f_n(x)$ should read $2f_{n-1}(n)/f_n(n)$, according to the author.

#2198: Kisilcyn, S. S.

The reviewer wishes to replace the last line of the review by the following. "This conjecture was disproved by L. R. Ford, Jr., and S. M. Johnson [*Amer. Math. Monthly* 66 (1959), 387-389; MR 21 #1942]."

#2463: Kukles, I. S.; Nurov, T.

The second displayed formula should be $\omega_2(x, y) = \frac{1}{2}(x^2 + y^2)$ and not $\omega_2(x, y) = \frac{1}{2}(x^2 - y^2)$. In addition, a more accurate reference to Ljapunov is the following: *General problem of the stability of motion* (Russian), pp. 206-207, GITTL, Moscow, 1950 [MR 12, 612].

#2780: Edelstein, Michael

In line 2, replace " $f^n(E^n)$ " by " $f^n(A)$, for any bounded $A \subset E^n$ ".
